I have a new 16 pill and I am useing a 5 pill driver, the driver is on 12 volts and makes 425 Bird, and when I hit the 16 that is on a different alt and 18 volts, it has a big amp draw and will only produce 1800 bird! I have around 5 watts reflect at 1800 and a SWR of 1.04!!!!!! so what's up? any ideas?

Having owned about 25 years ago the amateur version of this rig, the Swan 300 Sygnet with a 16-pole crystal filter no less, I would not wish it on my worst enemy. It is known to drift unless the bandswitch (yes it has one even as the Sillitronix) is kept scrupulously clean and the rig is kept on 24/7. As far as audio, it is the only instruction manual I have ever seen that contained the statement, "6db of flat-topping never hurt anyone." As I recall from a neighbor who had one, channels are not marked. I have no idea if it covers the 27.4-28.0 range.

You are well advised to use a Communications-style mike (Shure 554 I think was what I used) that cuts lows with a cap in the line to boost the hi tones a tad; the normal audio is a bit bassy for cutting thru pileups.

I doubt that the rig has improved with age but if you must, check out the price of the final before you make your decision.

Bobby, baby, lets assume for a second that you are correct in your interpration of the FCC regs. With the exception of perhaps one or two folks, I dont think anyone on this NG really much cares, nor is there any likelyhood of converting them to your point of view. A bloody waste of time.

Yes, you did. Get your facts straight. I told someone, "Happy DXing", and you interjected and blathered the accusation of me violating the 4 watt rule and 150 mile rule. Check your post. As I stated before, and I still maintain, the 150 mile rule is rubbish. If I key up and a fellow replies a continent away, and doesn't tell me his qth until the next transmission. well, that 150 mile rule just made me unintentionally break the law, agreed? First off, I doubt you could cite one single incident of an operator getting popped solely for talking skip. I didn't research it, just calling your bluff. Check it out and come make me eat crow. Secondly, there are many LEO's out there, some actually on this NG, who would be intentionally derelict in their duties of enforcing this type of legislation, it is called selective enforcement and happens all the time. Thirdly, if you break the law, you should be willing to accept the consequences, should they come around. Lastly, don't tell me about the Fla. guy that got popped because I live semi-close to him and know several who knew him. He REPEATEDLY interfered with a repeater in the area despite numerous warnings from your hero, Hollingsworth. Hell, with that kind of IQ, it's a great thing the law got hold of him. The law will not pass, son. The law enforcement associations will be vehemently opposed to this, UNLESS inducement are made, such as a percentage of the booty go to the cops that made the bust. More incentives for dirty cops. And just for the sake of it, if Mustaine is your other hero, disregard this entire post, you'll never get it.

"I'd rather believe that the tendency in consciousness is to seek freedom, in a completely individual way. It's important to not take any bullshit, to either go whole hog or not go at all."

My facts are straight. i have quoted part 47, part 95 and 97 of the FCC codes of rules and regulations.

>
> As I stated before, and
I> still maintain, the 150 mile rule is rubbish. If I key up and a
fellow
> replies a continent away, and doesn't tell me his qth until the next
> transmission. well, that 150 mile rule just made me unintentionally
> break the law, agreed?

The FCC doesn't require you to put up a force field to limit your RF wave distance to 150 miles, nor does it require you to try to alter the laws of physics OR play games with the nature of the ionosphere, to keep your radio waves from traveling greater than 150 miles. What it DOES do is require you to NOT intentionally do so, and if you are in the middle of a QSO and you then figure out that the party you are talking to is greater than 150 miles, you are to cease and desist immediately.

First off, I doubt you could cite one single
> incident of an operator getting popped solely for talking skip.

As a matter of fact, a very good friend of mine was hit for it many years ago, an FCC monitoring station actually observed his transmission to a station in P. Rico, recorded every bit of it and fined him accordingly. Yes, it has done so and continues to do so. better watch out for a man named Hollinsworth.

I
didn't
> research it, just calling your bluff. Check it out and come make me
eat
> crow.

been there done that.

Secondly, there are many LEO's out there, some actually on this
> NG, who would be intentionally derelict in their duties of enforcing
> this type of legislation, it is called selective enforcement and
happens
> all the time. Thirdly, if you break the law, you should be willing to

Hell,
> with that kind of IQ, it's a great thing the law got hold of him.

regardless, he was nailed, and he was not the ONLY one. it is happening with more and more frequency. You'd do well NOT to stand in front of a court magestrate, should it come down to it, and use this tactic to argue with the book of the law and a gavel that enforces it.

The
> law will not pass, son. The law enforcement associations will be
> vehemently opposed to this, UNLESS inducement are made, such as a
> percentage of the booty go to the cops that made the bust.

that's one of many proposals.

More
> incentives for dirty cops.

circular agument tactic there, not valid.

And just for the sake of it, if Mustaine is
> your other hero, disregard this entire post, you'll never get it.
>

And intentionally ignorant and shaking your fist at the law as it stands will get you nowhere even faster. By the way, your repeated use of the word "hero" is a little cliche not to mention erroneously used, as neither hollinsworth or dave mustaine are my heros. They are merely people I am quoting in one way or the other. One is a key law enforcement official, nothing more, the other is merely a lead singer in a heavy metal band. I guess if I were to use the explicitive "holy cow!" you'd say elsie was my hero, but I digress.

Check the voltage at the amp when keyed. What size alternator are you using to power the 16? What it is deadkeying and swinging to when you modulate. Last but not least, what brand of amp is the 16?

Ok, as some of you might know I am running my mobile as a base. I have a Grant XL, I am using a PC power supply to get the juice. Now this is the tricky part, I am trying to use my Mag Mount Wilson 5000, I mounted a aluminum plate to the roof of my house and placed the antenna on that, but my SWR is like 3+. Is this a groundplane problem? If so is there anyway I can fix this? If this is not the problem, what can it be and what can I do to fix it. adjusting the antenna doesn't fix the problem.

Mag mount? Aluminum? How?

First off the magnet may not make an intimate contact with the
aluminum plate. It is not forced downward. A magmount antenna requires
a complete capacitive coupling to the ground plane. The antenna will
not work well without it.

Secondly the ideal ground plane would be an 18 foot circle. It doesn't
have to be this big, but the bigger the better.

TW,

Exactly! I can't see why it's such an emotional thing. If you like it, OK. If you don't, OK. Now I will confess something. As I said in my post, CW was a requirement for any class of license when I got mine. So I reluctantly admit that when they came up with the no-code license, I was highly indignant. By golly, I had to do it, why don't them thar whipper snappers have to? LOL! Yada Yada Yada. The whole smear about "they gonna 'ruin' ham radio" and all that jazz. I was WRONG! As I worked the HF bands on CW and phone, I began to hear the new "KE" calls more and more. These guys were upgrading as fast, or faster, than I did! And all was well--in spite of what I thought! LOL! Life does, indeed, go on.

BTW, I had a really nice contact on the Cayman Islands while mobile to-day. It was on 24.960 MHZ, and I mean this guy was literally pegging me out at 60 over--I kid you not. Loudest contact I have ever had. Just BOOMIN' in. We both have the same rigs (Icom 706MKIIG), and he said I was 40 over as well. It is the first time I have ever had a DX station to peg my meter! Locals, of course, will do it if I'm close, but a DX station with 100 watts? That never happened before! We must've had a "pipeline" between the two of us. It was FUN!

Take care & 73

So this a mounting problem? How big of a piece of steel would I need, the
sheet metal is only a little larger than the base of the magnet.

And any such law is a bad idea! There's an old saying: Be careful what you wish for because you might GET it!

It has been said here before many times, but it is a BAD idea for (among others) the following reasons:

1. LEOS aren't well enough trained (for the most part) in electronics and the different types of radios to be able to properly enforce such regulations. For example, the public associates ALL sorts of radios with CB. It is the radio service that gets the most publicity. Cops, being non-electronic types, do the same thing.

2. The cost of doing so will be MORE than re-funding FCC to do the job they are supposed to do in the first place. FCC would be responsible for providing technical assistance to LEOS in enforcing said rules. How many local/state police departments ARE there? Do you mean to tell me that FCC would not be overwhelmed by the task of assisting multi-thousands of LEOS/departments in accomplishing such a task.

3. Because of the magnitude of such a thing, there WOULD be mistakes. Local Bubba sheriff goes to the home of a licensed ham wrongly thinking HE is the source of the complaint he received from Mrs Widow Next Door. Ham produces license. Sheriff doesn't like this affront to his authority. "Y'all never mind 'bout that 'ere piece of paper. I'm the law round h'yar, boy, and don't you fergit it. Now Ah'll just take that 'ere piece of 'reddy-o" 'quipment wid me." Can you say lawsuit? You betcha! And the ham would win against the sheriff.

And so on. It is a very bad law. And those of you hams who are thinking, "Waal, hee hee, hit's bout time them uppity CBers git what's a-comin' to 'em with their 'leenyars' and extra channels. I'm better than they are, and the local law can't touch me. NaNa NaNA, Boo Boo!" IF they get this thru, you just remember: Better watch what you ask for cuz you just might GET it! Remember it if a rambo cop jerks you out of your car, destroys your equipment jerking it out of the vehicle, and carts you off to jail for "disrespect of cop" (for attempting to show your license). Ever run into one of those cops who won't even let you say a word, and if you do, threatens to cart you off to the slammer?

The siltronix 1011C and D are marked with cb channels from 1-23. After that you need a good 6or7 digit freq. counter to tell where you are. Even on the cb freqs. It is a good idea to have one . Just keep one hand on the VFO and the other on the Mic all the time and they work well. As long as the amp tube lasts. and yes it has a band switch. do not think this is a good radio please concider one of the newer 10 meter rigs!!!
Jeff wrote in message ...

1658. 2 Questions: Peak & Tune, Antenna Mounting

Newsgroup: rec.radio.cb
Date: 2000-10-14 00:00:00 UTC
From: NufTime <nuftime@hotmail.com>
Message-ID: <MPG.1452bc00b3e1298d989680@news.lvcablemodem.com>
Source record: 55562

Question 1:
I am wondering if the "Peak & Tune" and "Scoping" is worth the little extra money??? Is this worth doing on lower end (less than $100) radios like, Midland or Uniden's? What does this get me in the end?

Question 2:
I have a light bar installed on top of my truck. I can just squeeze them under the garage door. The center hole, on the light bar is free to mount an antenna (has an old removable K40 in it now), or put a mag mount on. Is the flip down antenna mount the way to go with a Wilson, Silver load or, the Wilson, 5000 mag mount?

This antenna should "Complement" the Low End radio.
Any good setup ideas appreciated.

Thanks for your comments/suggestions.
NufTime

1659. Antron 99 Question

Newsgroup: rec.radio.cb

I know what HD means, it means "High Drive".... in other words, it can
be driven by a transmitter of greater than 4 watts PEP... usually around
10 watts or so is the sought after power level.

And all the same, it's illegal. It will not gain "type acceptance" if it
can amplify signals over 24 megahertz with less than 50 watts drive.

it is only illegal if you use it on 11 meters.
These amplifiers are LEGAL for Industrial, Scientific, Medical, Export
or
Licensed Amateur Radio Operators use only.
It is a violation of FCC regulations to operate these amplifiers on
the Citizens Band in the United States.

so whats all the fuss! who's to say what the person buying it,is going
to use it for.RIGHT!!!!

It is up to the person buying the amp to decide how they use it.

When I build stuff it is built according to my own needs and
specifications and well within the parameters of the same hardware
(such as low noise FET front ends as any of the major mfgs can
perovide. My stuff might not look as good aesthetically or be as
compact as commercially mass produced stuff but it serves my purpose
and is easier to service with the tools that I built it with. I don't
care how few Hams can build stuff but I do care if we forget to try to
teach those who might be interested in building stuff how easy it is to
do so. The costs are not excessive and are frequently less than the
cost of finished gear. I buy newly developed chips and other
components in small quantities of what I need from Digi-Key or Mouser.
I am a pack rat and save lots of parts. I salvage parts from old used
equipment. I buy stuff at HamFests. In short I know what I may be
needing and I buy it of canabalize junk to get it. I have many low
voltage power supplies on hand for experimentation and can easily
duplicate them from parts on my shelf. Often the junk has been built to
MIL standards and the parts are of high quality....sometimes higher
quality than mass producers might use. I test new circuits on
solderless contact boards before building the finished product. For RF
circuitry I don't always use PC boards. Sometimes I use a matal ground
plane in which I mount teflon standoff terminals for point to point
wiring. Sometimes I do use stripline PC boards...but only when this is
necessary.

Some say that Columbus did not discover America because there were people already here. If I build a new circuit using a 555 chip and some blinking LEDs I might not be discovering anything that others have not been able to discover....but it is for me a discovery; Just like when I discover where I left my can keys after I lost them...it is a satisfaction!

> What kind of gear are you going
> to build out of this stuff? A morse decoder that won't work because most
> fists are too poor to copy?
Morse decoders that won't work may be troubled by their software. This is a problem that is evident in the commercial decoders as well.

> An archaic QRP rig?

It is not archaic if it meets or beats the specs that a commercial rig can provide. There are only QRP xmitters...Receivers IMHO are tasked to do the same job in any case.
> With all due respect for
> TAPR, how are you going to advance the art by breadboarding somebody
> else's design using Radio Shack components?

If I find any bugs I would report them to TAPR. To be honest I have not built any TAPR kits...but I do read TAPR literture and may try building their kits or duplicating them in the future. I am especially interested in Spread Spectrum and if all goes well with others who use it I may be building some stuff that can communicate with them...but first I must learn as much as will be needed. I can not get it all from text books such as Dixon...nor fro ARRL pubs. To boil it down to actual design with real components I must underrstand all that is needed first. Now...even if I never live to actually building any SS gear, I can enjoy planning to do so...Just as some people enjoy planning to build a house or garder even though they may never be able to astually do so. I can build "breadboard" circuits that would be part of the finished product and see if they can function properly. Even if I don't build an entire working system I can get some self satisfaction out of that and I can understand the difficulties involved for others and appreciate their innovation if my circuits fail as well.

> - not even Uncle Sam can afford to custom design and build his own

> hardware any more. It isn't cost-effective and the gear is outdated
> before we can get it to the fleet.

I know! I worked on many government projects as an EE. You are preaching to the chior on that point...but my cellar is not a government job operation and I don't have to work under the burocracy of government regulations and MIL specs...nor do I have to satisfy a corporate leadership that often fights innovation. That is the beauty of being a Ham experimenter. It is legal to build anything except weapons of distruction as long as you only test it on the air within the rules of Part 97. You can build a lot of stuff that they won't let you build at work. I have tried out some ideas at home in the past that I later did use in the designs of test equipment that I was able to use at work. A m,issing pulse detector which can sync up serial pulses was tested by me at home before I promised to design a serial to parallel digital converter at work. If I had not tested the circuit on my own I would not have been able to promise that I could design the converter at work because I wouldn't have been confident that it would work. I also use crude temperature testing and troubleshhoting at home...a heat gun for hot and freon cold spray for cold. I couldn't use these methods at work wher the bureaucracy might insist on more precise work to be done by environmental testing engineers in another department before proceeding to build the end product. Such testing could take months or even years...just as incoming inspection of each component often does.

> I fear your statements re: the internet and population are true. In that
> case, Amateur radio has no future and we may as well turn over 2-meters
> to the CBrs
> and the HF bands to businesses.

AMATEUR RADIO has a FUTURE...If and only if hams behave as real hams. If they want to just be fun operators and customers for Japanese manufactured products it has no future. Eventually the Hams will discover that they are being led by the Japanese designers who decide on what is going to be made available to them and advertised rather than the hams themselves. Hams can never survive solely as users. Even the ARRL may eventually realize that. I hope it is not going to be too late for them to do so.

>
> As far as hobby homebrewing providing qualified technical people, you
> must be joking. Tech's who breadboard other peoples' designs are a

> design new circuits but now only the best EEs - the top 1% perhaps -
are
> designing circuits for chipmakers and the rest are overpaid techs
using
> those chips like legos.

Yep...I've used chips and components like LEGOs. Some techs can do
that and some can't. Some degreed EEs can do that and some can't. And
worst of all; Some engineering managers not only can't but don't know
how to get any value out of those who can.

> Hell, most are coding software because there are
> more EEs than real EE jobs! Nothing you can build out of Radio Shack
> components is going to train anyone to join that 1%. Sorry ....

I disagree...but I would include Digi-Key and/or Mouser parts with the
RS parts.

> > Do you want Hams to only think like CBers? Or do you just expect

think
> > about what the difference is between CBers and Hams.
>
> Hmmm.. we say "roger" and "OM" instead of "10-4" and "good buddy"? ;o)

Yeah...but lingo is not the same as innmovation.

> It may be a blow to your self esteem OM, but from my perspective there
> has been little difference since economics turned us into "appliance
> hams". Federal law makes CBrs buy COTS equipment; economics makes most
> hams do likewise.

Not economy...I beg to differ...but ARRL's economy which sees Hams as
users of their pubs and customers for their advertisers and not as
radio experimenters. That is the only reason that I bad mouth the
direction being taken by most present Ham leaders.

> A tiny percent of CBrs violate FCC law to build their
> own gear; a tiny percent of hams violate economic common sense to do
> likewise.

Not economic common sense in the case of Hams...just Hams who have been
taught to emphasize the wrong basis and purpose for the entire hobby.

> A few bad apples poison the CB barrel and judging by FCC
> enforcement logs a few hams do likewise. The major difference I see is

> that Amateurs properly report the bad apples and help the FCC catch
them
> while CBrs do not, but that could be rectified.

Sometimes CBers do help to locate the bad apples.. Those who run only 5
watts don't always go along with those who run 500 watts.

> > You can start by reading the Basis and Purpose of Ham Radio ...

> (d) Expansion of the existing reservoir within the amateur radio
> service of trained operators, technicians, and electronics experts."
>
> Do you suggest that we are doing these things using Radio Shack
> components?

Not entirely...but it might be a starting point and is far better than
just assuming that the best Hams are the one's whose ECONOMIC condition
permits them to buy the best Japanese boxes that their money can buy.
There are some Hams who can't even put a BNC connector on a peice of
coax. BNC connectors and coax cable are available in RS for tjhose who
want to practice doing so themselves. I suggest that they don't buy
the "solderless" type connectors that are ment for audio appliances.

> > Why do you think that Hams are the only group of operators who are
> > permitted to build and service their own equipment?
> >
> For the same reason that my grandfather got to fly without taking an
FAA
> exam: because it made sense back then. When the service was
established,

AHH!...but it still makes sense for many Hams who don't think like you
do.

> and radio was in its infancy, amateurs did indeed contribute a lot to
> the state of the art, both technically and operationally, and morse
code

Spread Spectrum is now in its infancy. The interleaving of many
digitized duplex signals within the bandwidth formally reqiired for one
simplex signal is now proven possible commercially. This is in its
infancy as far as Ham Radio goes. I doubt if the Japanese designers
will introduce us to it as long as they can continue to sell what is
basically the same stuff that has been around for 30 years. It is up
to Hams themselves to adopt this technology to Ham Radio.

> was essential to operating proficiency. This is no longer true. Those
> who have contributed in the last decade or so may have been amateurs

by
> coincidence but they didn't contribute *because* they were amateurs;
> they contributed because they had access to well funded labs. So, to
> address your question, the reason we still have the privileges they
> earned is that we have so strong a lobby that taking away those
> privileges has been politically unwise ... but that lobby is
shrinking.

It is now easier to devise your own pulse generator from RS parts and
to adapt a computer to be a pulse analyser than it ever was in the
past. Innovation may be better than a well equiped lab for the Hams
who can make use of what they have.

> > Hams need MORE license classes and/or endorsements.
>
> I have a better idea. Let's have just one class with one test: in one

> to the latest COTS transceivers without duplicating any of their
> designs. That way there won't be so many people "cluttering up" the
> bands, right? Not even you or I ... :o(

Nah...I don't expect all Hams to be receiver designers...Many might
have more fun designing companders or digital filters or whatever other
specialty they seek to acquire. Some will still be Hams just to
collect DX QSL cards and that is OK as long as they are constantly
trying to modify and update existing antennas, hardware front ends and
software modes to improve their efficiency.

> > Does the name Pavlov ring a bell?
>
> Indeed it does. Pavlov demo'd that one could cause a biological
response
> by showing some abstract figure only, and the key is "only", just
before
> the subject got to eat, et cetera.

Me thinks that you may understand Pavlov's experiment but remember that
it wasn't done on people. You could be mixing up Pavlov with Skinner.
Skinner worked with other animals.
Pavlov rang a bell every time his dogs were fed...After a while, the
dogs began to salivate after a bell was rung, even when they were not
being fed anything. I apply Pavlov's experiment to Hams as
follows:...As you said, in the old days Hams had fun building radio
transmitters and working other Hams on the air...Now they have been
conditioned to have fun just by working other Hams on the air, by
advertisements...But the real meat and potatoes of Ham Radio is
gone...and if this doesn't get turned around Ham Radio will surely go
to the "Pavlov conditioned" dogs rather than thinking humans.

> You may also know that porn is
> defined as that which arouses us sexually. It follows that censorship
> creates porn by turning otherwise common items into porn by denying us

> their common view and instead allowing us to see them only just before
> sex. How about them apples?

Each of us may have any kind of opinion about porn, depending on our own hormone systems, our cultural conditioning, etc. This is quite a big subject but IMHO may have little to do with Ham Radio directly. In fact it is worthwhile hobbies, like Ham Radio, which can get our minds off porn in our spare time. Porn can become an obsession that can take up all of the spare time of some people, which is unfortunately not as reproductive as real marital sex...and can't be done well with devises that can be bought in Radio Shack either.

PCs can introduce us to porn...How about those Apples?...Maybe Eve gave Adam an Apple and he made her get dressed so she could tease him by being a stripper and getting undressed before there was any censorship or adult verification. Yep...That is probably how porn was born...because before that they didn't wear any cloths all of the time...so it wasn't usually a hard and fast big thing.

Some Hams like to be teased by the uncertainty of propagation conditions. Some Hams prefer the certainty of their own technical abilities. They want to be productive. Some folks want to be teased by porn. They may subconciously want to be reproductive but can't be without actually making real contacts. Some folks are just natural fruitful multipliers and propagate humanity so that it continues to survive.

> 73 all, de KA3DWW

Hams need more license classes and or technical endorsements.

You better check your ham by-laws and FCC rules & regulations... That
amplifier is NOT "type accepted", so ham or not, legal frequency or not,
it is illegal to use. If it can amplify an RF signal over 24 megahertz
on the HF bands, and can do so with less than fifty watts of drive, than
it is disqualified from "type acceptance".

Good story and I can appreciate anyone who wants to use code should use code. As you say to each their own. But just to be clear, I never said I didn't understand code or that it was a barrier to licensing. I, like yourself, could care less what they do with the law. They'll do away with the rule requiring Morse eventually and folks will STILL learn code, but because they want to, for the same rush that you take from it, but not because they HAVE to. It's the principle of the matter here, not the code. Code, I imagine, can be fun for some, as much as any other mode.....as a hobby.

Don't waste money on a walkie talkie. To talk to anybody you will
need to hook up an external antenna. Once you start the motor, you
will need to turn on the ANL. Get a mobile radio and a decent antenna.

A good starter antenna is a Wilson 1000.

Sir,
why do you think people "clip parts" they are experimenting they cant all have degrees in electronics some beginners still like to have a look and see whats going on under the bonnet. If manufacturers made it easier for the layman to have a dabble there wouldn't be so many fry-ups.Most enthusiasts don't just want to buy and use that's not what the hobby is about that's why its called amateur radio...so don't critise try and be more helpful .im sorry but you are coming across as a knowitall .
why don't you be more constructive and post a message advertising classes for beginners to teach them how not to fry their rigs.Why do you refer to starting an argument!!! surely you mean a constructive discussion an argument is to imply shouting and general dissaray. Are you the kind of person that enjoys an argument??????
This again comes across as arrogant in that you think people are only capable of argumental behavior .

Hello Sam: Yeah that may be for the English folks in England, you
people are big time different. But not for the your big brother folks in
the Great United States.

I spent a year over there in England. Had to pay I think 65 pounds
(almost $100 US Dollars) for a TV watchin license, what a bunch of crap.
You guys surly allow your government to push you around too much.

You goof balls would surly be doing the goose step and singing the
German National Anthem, if it wasn't for the United States. We don't
need no stinking TV watchin license.

Jay in the Great Mojave Desert, ... Listening to Rock & Roll music
and workin on antennas, just down the road ah ways from the fillin
station.

Since you never seem to give your real occupation... it must be embarrassing
indeed.
You sir are not much... and from the looks of it... will never compete in
the real world. All you can do for now is attack people who do...

Source record: 55596

The voltage readings are taken at the amp and it is 18 volts until I key then they drop to around 14, I use 8-8 volt deep cycle batteries to make my 16 volt system and 1-200 apm alt. The dead key is 250 bird and it swings to 1800 at best before the voltage drops to 14 and at that point it will make around 1400 bird. I am useing a 2500 slug. This is a No Name amp that has just been rebuilt. I have ran other boxes on this system with no problems, it is just this box that has this effect

>Check the voltage at the amp when keyed. What size alternator are you using
>to power the 16? What it is deadkeying and swinging to when you modulate.
>Last but not least, what brand of amp is the 16?

That's not "name calling", it's an opinion. Just like your opinion that people on this forum wish to read what you write on this subject. Take a poll of the group members. Do you really think anyone here is interested in your "scare tactics"? That's called trolling, stirring the pot, starting controversy. Maybe there's a newsgroup for you and those few on here like you "rec.radio.legal", or "rec.radio.tattletale", or maybe "rec.radio.enforcement". My opinion.

1688. FS: PDC-600 SWR/WATT/MOD

Newsgroup: rec.radio.cb
Date: 2000-10-15 00:00:00 UTC

Para Dynamics PDC-600 - SWR, Watt(1kw) & Modulation meter. 3 seperate meters, works accurately (give or take a few watts here or there... hey! it's "Para Dynamics" not a "Byrd" meter). On the scale it's 9 out of 10, of course #10 being the best, we have to mentioned that because of all the stupid people out there who think #10 is N.G. and #1 is the best and you know who you are? Also, no lighted meters... Price is $50.00 maybe shipped, depends why you are located!

Message-ID: <20001015091543.04500.00001811@ng-mf1.aol.com>
Source record: 55755

I have a 2-tube amp. The only name on the unit is "Afterburner" - there is also a metal plate that is rivited to the transformer on the back that states it is for use on the 10meter & 6meter bands - but works great on 11meter too... The unit does just about 100 watts, but it gives you a that nice warm tube audio tone.
Whether you need a little extra power or need to run something bigger.

Well rev, for starters, i think that you could use some more alternator. Also, what box did you have before and what kind of numbers were you seeing from it?? You should definately not be dropping to 14 volts. What size power wire are you using and how long of a run with this wire? You should be close to puttin that 2500 slug in the corner. Also, what are you using for a driver??? I know before i got another alternator i had my 16-pill xforce on one 200 amp and it wouldn't hold volts at all.

No. Again, you replied to a post of mine saying it would be "funny" when I end up in front of a magistrate for violating the 4 watt rule, therefore implying I use more than the allowed wattage. You were wrong and now you're back pedaling. Again, go back and read what you posted.

Play games with the nature of the ionosphere? Please! Nature is nature and all the legislation in the world will not change that. I understand the law perfectly, and the 150 mile rule is BS! I'm not arguing of the laws existence, just the merit.

I don't believe you about someone you are aware of getting popped for only shooting skip. Maybe in the seventies that took place, but not in the last twenty years. By the way, the name you invoke so often is "Hollingsworth". If what you say is true, it wouldn't be hard to find it through a search, after all, it is public records. Been there done that? Afraid not! Just 'cause you say it, don't make it so. Once again, prove it. Since you say it happened, find it, post it, and I'll feast on a big plate of crow. I don't believe you can. For your info., it's NOT happening more and more..go to www.rainreport.com for the weekly updates and activities of Hollingsworth. The only ones getting popped are the hammies.

Circular argument? Highly doubtful. The war on drugs (read:people) created hordes of cops blatantly violating the law they were sworn to uphold by sharing in the monetary value of their busts. Pass this law and more law abiding citizens, especially hammies, will have their rights violated and equipment wrongfully confiscated. Do you actually think for one second that Congress will throw $$$ at the FCC for the entire training and instruction of local LEOs across the country? Where is this cash cow going to come from?

Shaking fists defiantly at the law may not help either of our positions, but blatant disrespect for laws that one feels are invalid is one way change comes about. If it wasn't for folks questioning and rebuking authority they feel is wrong once in a while, you'd still be paying homage to England, buying a license to watch the telly, and drinking foul beer.

I know who Mustaine is, (talk about shaking fists in defiance) which is why I questioned you quoting him. He will never be accused of impersonating a mental giant or philosopher, (too selfish, self-centered, and materialistic, can you say SELLOUT?) but he appears to have a disciple in you, so to each their own.

All the Alternators . . .

I run a Comp 16 with:
(1) factory alternator
(4) clean non smelling batteries
(1) maul

14.2 to 21 volts

18 volts daily

417 pounds of batteries

10 lb maul

I run the driver on the factory 105

How sweet it is
seen a 6 pill hit two grand and held for awhile
didn't realize the fan wasn't running

Coming soon . . .
Available now . . .

Dennis Toll others,

I have 5 Johnsons Valiants
Different years
the reciever mod was performed by someone unknown (all 5 of these plus a 62)

wired for a four pin conventional hookup
Cobra standard

no mods are suppose to be needed on the Cobra, Galaxy etc being used for the transmitter

the two I have had in the past, had Browning R23's wired for them

The problem is these are suppose to track transmit as well as recieve

100 dead key swinging 350 on the bird

Can't make it track and the VFO is disconneted
This guy who did these did a good job from tyhe looks of things

just no instructions have been handed along the chain has been broken
Any help would be Appriciated

Brass

What mics work the best on these
I use to use a old EV
I have a magnetic controlled Johnson (new) don't know if that will work or not

news:39E45D01.276C23A7@vlsi.polymtl.ca...

hello,
what about a croosband repeater ????

last two weeks I worked on a very very cheap homemade repeater.

my problem was when I was outside of my car I was not able
to talk with my radio (example when going in a shop)
So I decided to made a very simple repeater.

you have to get two frs radio
the trick is to inject audio from the frs into the mobil in your car
and vice versa.

So when I speak in my frs outside of my car the other frs in the car
receive
audio and inject it in the mobil and activate the PTT.

when the mobil receive audio it goes in the frs and you receive
what your friend say.

On my side I have a VHF mobil in the car, and on my base station too.

Of course you can put ctcss on your frs to prevent noise activating the
PTT.

I'm working on a new version of my repeater.

Hint: it<s usefull to know vox circuitry.

hack crack.....

Hello, I have a CDE model CD44 antenna rotator (pre- HyGain/Telex).. This rotor is capable of turning an 8.5 sq.ft. windload. I also have 2 control boxes for this unit, an accesory shelf, and 20 feet of 8-conductor rotor cable (test-lead).. ALL of these items are in very good working condition. I would be willing to let all of these items go, in a package deal for $175.00 .(buyer pays shipping)..... I also will consider trades, looking for base beam (Maco Comet), or a Galaxy 55 mobile radio (new-in-box only) Thanks for reading.....

> back.............<snip>.

Agreed..... but I would suspect that VERY FEW (if ANY) of the newcomers to amateur radio chose to become hams in order to provide 'Emergency Communications' to the community. Most, I believe, enter it (at the VHF level) for 'personal communications and enjoyment of electronics/technology hobbies... an area in which amateur radio has LOADS of competition.

I was only making the point that the competition for the attention of 'possible' new hams is fierce and growing fiercer. As long as long term blackouts, cell system overloads and other disasters stay a rarity, rather than common-place, computers, the internet, cell phones, etc etc, will continue to overshadow amateur radio as a 'potential' hobby to many younger folks.

The OLD ones made in Malasia are good (Same as GALAXY) but the NEW ones
are MADE IN RED CHINA and I'm afraid that they will be AS BAD as the
Northstars also made in China. The NEW Version of the Connex HP is
the General Robert E . LEE (General Lee). DON'T buty ANY THING made in
China. YOU WILL be sorry!!!!

1728. B&K 1040 & 2040 CB Receive generator for Sale

Newsgroup: rec.radio.cb
Date: 2000-10-15 00:00:00 UTC
From: truth@planetc.com
Message-ID: <8scvuv$sm9$1@nnrp1.deja.com>
Source record: 55789

I have in EXCELLENT SHAPE this receive generator and mic imput console
for tuning up the RECEIVE SECTION of CB's. Were owned by a shop that
did car stereo, speedometers, car alarms as well as CB (were in biz
over 50 years). They got old & got out of it, along with car alarm
business going to the corporates instead of the Little Man. So not a
lot of use on them--they are in GREAT shape!
Cost is $425 & ship. E mail me @ truth@planetc.com if interested OR
if you have any questions. Dave

Connect and use. you can improve the antenna with a GP kit. You can also improve the antenna by using the 5' firestick they make for the a99 or take a 5' firestickII, remove the screw in the end of the antenna and use it as your top section. I've got the I-MAX 2000 and use a firestick II as the top section. It really improved it's performance.

That could be used as an excuse to say anything...

"You're a MUDSUCKER!" Oh, that's not name calling, that's just my
oppinion.

Just like your opinion
that people
> on this forum wish to read what you write on this subject.

Well, obviously they do, just like you did.

Take a poll
of the
> group members. Do you really think anyone here is interested in your
"scare
> tactics"?

(1) It's not a case of who is interested in reading what, it's a case
where this is simply a forum to post ideas, thoughts or questions.
That's what I did, and people have read them and responded. It's what is
suppose to happen in a newsgroup. ANYBODY has the option to NOT read
anything I, you or anyone else posts. Kinda goes along with the "free
will" concept.

That's called trolling, stirring the pot, starting
controversy.

I don't see the point in that, I mean, whether it's just the posting of
a conflicting idea/ retort, such as I did, or purposefully starting
trouble. now THAT is your oppinion. If I wanted to start controversy
just for it's own sake, I would not do it here, but then again, I
wouldn't do it anywhere "just for it's own sake". If you think I do,
then, once again, THAT is an example of an oppinion.

> Maybe there's a newsgroup for you and those few on here like you
> "rec.radio.legal", or "rec.radio.tattletale", or maybe

"rec.radio.enforcement".
> My opinion.

there are such newsgroups, and I do subscribe to them, just as many
others who come in here also do. Another fine example of that "free
will" concept. I believe your use of the word "tattletale" was not out
of a pure concept or idea, I believe (my oppinion), THAT was meant to
"stir the pot" and "start controversy". On the other hand, that wouldn't
be the FIRST incident in this NG, any other NG or any other sort of
forum, for that matter, where a person comes in and blatantly slings
around accusations and "lays seeds" hoping they germinate into an idea
the possess, when it is themselves who are guilty of it.

e.g., calling me a troll.

> No. Again, you replied to a post of mine saying it would be "funny"
> when I end up in front of a magistrate for violating the 4 watt rule,
> therefore implying I use more than the allowed wattage.

What you were saying is that you were doing nothing wrong, and that the 150 mile rule was "rubbish", as it were, that it "wasn't your fault" if you communicated with somebody beyond this limit unknowingly.

You were wrong
> and now you're back pedaling.

backpedaling is going back and changing what you said and claimed because you have changed your mind or want to get another idea across than you originally intended. I did neither.

Again, go back and read what you posted.

Okay, I will again, as I already have.
>
> Play games with the nature of the ionosphere? Please! Nature is
nature
> and all the legislation in the world will not change that.

Of course. I wouldn't try to say otherwise. in fact, I'm claiming the FCC, likewise, doesn't expect you to do either. What I AM saying is that they expect you to stay within the guidlines that they lay out, which IS withing your power, i.e. the 150 mile limit, 4 watts PEP, no more than 100% modulation of a doubles-sideband AM carrier transmission, etc. (and no, i'm not accusing you of overmodulation, i'm just laying out examples, before you jump that gun as well)

I
understand
> the law perfectly, and the 150 mile rule is BS! I'm not arguing of the
> laws existence, just the merit.

Oh, okay, you're saying you do not agree with the 150 mile limit. that's fine. I do not agree that I should be limited to 70 mph on the interstate freeways, yet if I do violate that rule, I am fined, and it would not stand me in good ground to tell a judge "oh, that 70 mph rule is just BS!"

>
> I don't believe you about someone you are aware of getting popped for
> only shooting skip.

I'll get you his name, and the case # (if such exists), and all the information and you can research it.

Maybe in the seventies that took place, but not in
> the last twenty years.

It hasn't taken place in the last few decades NOT because the law has changed, but because of a laxness in enforcement. That is changing. That is my point.

By the way, the name you invoke so often is
> "Hollingsworth".

yes, and your point there is? did I mispell it? okay, i'll give you that victory. you have beaten me on a level of grammar.

Been there done
that?
> Afraid not! Just 'cause you say it, don't make it so. Once again,
prove
> it. Since you say it happened, find it, post it, and I'll feast on a
big
> plate of crow. I don't believe you can. For your info., it's NOT
> happening more and more..go to www.rainreport.com for the weekly
updates
> and activities of Hollingsworth. The only ones getting popped are the
> hammies.

My point here is that if the legislation goes through, and local law enforcement IS charged with enforcing laws, things will stiffen up even tighter. I disagree that things are getting easier and easier, but we can choke that proverbial horse all day long. Keep looking at the FCC websites and such, you'll find out.

>
> Circular argument? Highly doubtful. The war on drugs (read:people)
> created hordes of cops blatantly violating the law they were sworn to
> uphold by sharing in the monetary value of their busts.

Simply because there are a few bad cops that go astray from the right path doesn't mean the law they are enforcing is bogus or misplaced, or even more, simply doesn't exist. If that were true, NO laws should be followed or obeyed.... such as jaywalking, speeding, wreckless driving, etc.. just because some of the cops that enforce them are bad. The messenger has very little to do with the message, other than bringing it to you and informing you of it.

Pass this law
> and more law abiding citizens, especially hammies, will have their
> rights violated and equipment wrongfully confiscated.

The way to combat this problem is to stay vigilant and well informed of what is taking place on the administrative and executive levels of law enforcement, and hault such encroachments on freedom where it happens.

to do any less, you may as well throw in the towel, not just on this topic but all others.

Do you actually
> think for one second that Congress will throw $$$ at the FCC for the
> entire training and instruction of local LEOs across the country?

No, i never said they would.

Where
> is this cash cow going to come from?

so when has the governement EVER stopped to consider how a concept, idea or program is going to be funded before it legislated it? It has always haphazardly slung it's weight around and, if what it did got payed for, fine, if not, they didn't care anyway. They'll get thier money from you through one tax or another. Perhaps through fines from violating thier laws and regulations.

>
> Shaking fists defiantly at the law may not help either of our
> positions, but blatant disrespect for laws that one feels are invalid
is
> one way change comes about.

voting at the ballot box is the way to do it. The FCC five member board appointed by the president, who is elected by you, me and the rest of the population eligable to do so. Make your oppinion known that way, just as you would for the supreme court and other bodies that we do not directly, but INDIRECTLY, control.

If it wasn't for folks questioning and
> rebuking authority they feel is wrong once in a while, you'd still be
> paying homage to England, buying a license to watch the telly, and
> drinking foul beer.

Yes, you are correct. I'll give you that one. You made a keen grasp of the obvious there.

>
> I know who Mustaine is, (talk about shaking fists in defiance) which
is
> why I questioned you quoting him.

I am quoting him simply because that line out of one of the songs he sings in, in my oppinion, is very thought-provoking. Sometimes even the lowliest of people can come up with the highest and mightiest of ideas.

He will never be accused of
> impersonating a mental giant or philosopher,

Agreed. I guess he'll just have to continue with his musical career, as he has been.

(too selfish,
> self-centered, and materialistic, can you say SELLOUT?) but he appears
> to have a disciple in you, so to each their own.
>
>

well, you attempted to undermind my position and degrade my stand by
broadly making an character-assasinating acclamation. It's called a
"blanket tactic". I'm not his disciple. I am a person who purchased a
few cd's that his band recorded music on. That's all. I am no more his
"disciple" than I am of that ficticious cow Elsie.

well, that is your own fault for reading more into the taglines than
you should. Some people even put in funny quotations; does that mean
that they're deluded? some people put nothing at all; does that mean
that all those people are simple-minded or vegetables? It's just
something at the end of a letter that sometimes means little more than
just what it is saying... go figure, a person's entire life and outlook
isn't always put in a nutshell by a few lines he or she has at the end
of a NG post.

HI,
Just wondering if any of you had any experience with the Galaxy DX949 radio. I am especially interest to know how stable it is for frequency drift, what sorta audio on SSB one can expect with a decent mic on it, and how easy is it to get the extra freq's out of it. Any info one can give on this rig will be much appreciated.
Jagzilla

The guy named Bob Bieker that advertises here from
time to time has pretty good prices and decent service.
I bought from him once before, and have an order
pending with him right now. Here's a link:

Iv'e used a magmunt as a base antenna by taking a big coffe can lid and soldering 4 9ft radials to it. I sat it on the ridge of the roof and tacked it in place with a roofing nail and let 2 of the radials droop down each side of the roof. I could work 20 miles base to base easy enough like this.

Swells8069 wrote:
>
> The older ones had a 02a PLL chip

Only one Sears SSB radio had the PLL02A - Sears model 60006
There were two AM radios - 60105 and 242.3816 that had the PLL02A.
There are a couple of models with the (NPC)SM5104 and several other
models with several other chips. There was not *one* company that
made the radios for Sears.
Hope that helps

I was visiting down in Ga and FL this past week and a guy down there showed me something I had never considered about a coil antenna. He showed me that a coil antenna can give a better signal than a full 1/4 wavelength antenna if the antenna on th other end is a coil antenna and they are close enough together. He showed me the test on a straight section of US 82 in south Ga. at about 1/2 a mile there was a clear difference between a coil and a straight antenna. At a mile there wa no measurable difference between the antennas. I guess this means if the watergate is using a big ugly antenna you should too.

It is not an export radio. It is a legal cb radio.
You can spend a little more and get a better radio from
www.exportradios.com
They have some SuperStar radios on special. Later

Message-ID: <14250-39EA2B13-108@storefull-161.iap.bryant.webtv.net>
Source record: 55814

I have a Uniden Washington Base Station, and I have a problem with it. It's only about 5 months old. When I bought it, I took it to the CB shop to have it peeked, tuned, and I also had a Roger Beep board installed. I had no problems with it for months, until one day the fuse blew in the radio. It uses a 4 amp fuse. So I put a new one in it, and of course it also blew. I put a 6 amp fuse in it, and it has normal performance. But the fuse gets very hot. I won't use a 6 amp anymore, because it could destroy the radio. Even if I put a 5 amp it still blows. If I hook it up to DC... to a battery, it will still blow the fuse. I've tried changing mic's to. I normally run a Palomar 225 in line with the radio. It blows all 4 amp fuses thats required for the radio...like if i was to put a 6 or 7 amp fuse in the radio, it would not blow it, but it will get HOT... if i take it out after using the radio you can feel the heat from the fuse.... like it's ready to blow. Does anyone know a possible cause of this kind of problem? Or maybe what I could do to fix it? Any information would be great... Thanks.

well i believe that those coil antennas are a fad, a fantasy, and some
folks think it is cool to parade around with that thing on their
suburbans , whatever, i think you would be hard pressed to beat a
electrically resonant 1/4 wave whip, i think really those coil antennas
are just a sales gimmick. i am anxious to try out the star gunns and
see how they fare, cd is out.................

What kind of experiences are you looking for ? Be more specific . Here is
the reliability factor :
If you get a good one it will be your buddy for a long time and sound great
. Get a crappy one and
you might as well toss it in the garbage can because they can be a headache
for sure. And try and find
someone who is GOOD and KNOWS these radios , in regards to repairs and such
.
I`ve had mine since 1992 and the only thing I`ve had to do was
replace the memory battery and the front display bulbs burnt out .I`ve also
heard my share of shiTTy ones too . Happy DXing !

Jeff

brass, can i have the ebonics course you are taking so I can follow along with your posts
What is the difference between a comp 16 an a non comp 16? Besides a few extra bucks
What is a clean non smelling battery? Compared to a smelly one?
You can take your 417 lbs of batteries
Ill take 2 alternators and a capacitor bank system, no smell , no 417 lbs and the ability to charge at any volts without overboil and the best part you never have to replace a battery again. And all the amps from the alternator go to the amplifier not charging 400+ lbs of battery... How sweet that is ...
Available Now ...
Been available ...

Message-ID: <%hrG5.111387$47.1416440@news.bc.tac.net>
Source record: 55823

Hi,
Since I'm on a roll in here for asking questions about radios, just thought I'd ask you guys your opinion on the chrome face Superstar 3900. What do you think of audio output quality of the thing, especially on ssb? How stable is it for freq drift? How reliable a radio is it etc.? Can the roger beep be turned off? If not, is there a mod to kill it? I'm thinking of buying one of these units, so any advice and your experiences, good and bad, will be greatly appreciated.
Jagzilla

1763. Re: FA PALOMAR 250 3-30MHZ LINEAR AMPLIFIER

Newsgroup: rec.radio.cb
Date: 2000-10-15 00:00:00 UTC
From: twistedhed@webtv.net

Source record: 55824

Ok, we seem to have at least reached an agreement to disagree, somewhat. When you stated something alluding to the fact of me "violating the 4 watt rule" (and you did), that is accusing me of running in excess of the allowed output power, is it not? Violating the 150 mile rule, at least in my case, has NOTHING to do with my power output. For you to focus solely on that, which, I reiterate, has nothing to do with my power output, and gloss over the accusatory statement referring to "my standing before a magistrate in violation of the 4 watt rule" is to imply that I am running power. To suggest otherwise, put simply, is back pedaling, which is exactly what you did, concerning that particular statement.

No gun jumping here, my friend. Audio is my forte of choice. Freely admitted.

Interesting analogy, concerning the speed limits and power rule. In fact, I think it's a great analogy. Some states still have 55 on interstates. Outdated, like the 150 mile rule. When I am on the road on an interstate and conditions permit, yes, I go above the posted speed, as the majority of motorists do. I will admit that. You don't speed? You never speed, huh? If the posted limit is 55, and I'm doing 60, and a whole caravan blows past me so fast that it rocks my vehicle, well, that tells me those folks don't give a hoot about anyone, including themselves, or they are more than willing to pay the fine, should they get caught. I'm willing to pay a fine for going 5 miles over the limit, but not 25 over the limit. The same applies to my radio use. I am not willing to pay huge fines for splattering the spectrum with a gazillion watts, so I don't do it. But should it come down to me getting popped for telling someone in another state to have a good day, well, I am willing to take it on.

You don't think things are getting easier and easier? Well, maybe not for the hammies, but with an increasing number of pirate radio stations popping up, the proliferation of amps, keydowns open to the public, etc., etc., I'd say you are wrong. As you say, just an opinion. And, I do stay informed of the happenings of the FCC.

Never said that the laws are flawed because of who are enforcing them. The laws already are flawed, no matter who enforces them, and many, whether intentionally or not, enhance the criminal status of law abiding citizens and LEO's alike. To make a blanket statement that "one might as well disobey all laws" is simply ludicrous and stands on it's own as a perfect example of absurdity. There are good laws, and there are bad laws.

It sounds like you tend to agree the cash will not be allocated. No cash, how will things change?

As far as voting to make a difference, until the entire electoral process is done away with, or at least revamped, and other parties are given equal treatment, your vote, and mine, do not mean squat.

Never meant to malign your character, and I apologize if you took it as such. What I was in all actuality doing, was questioning your credibility and integrity of the issues. As far as the Mustaine remark, since it is part of your signature of your posts, it is fair game. Again, just an opinion. No blanket concept there, just going by what you posted.

Plus with an alternators you get a jet engine sound to get your adrenaline pumping. I would not know how to key with out revving the motor. I think the motor maul is cool, I build what to me is the best one out there. I don't mass produce them so they are not very common. Most of them I have seen are way under built. I like them for what they are but not for the replacement of an alternator, not that they will not work because they will, and work very well if built right. But most of them are not bullet proof like an alternator unless the builder really spends the extra money to make it right. I have yet to see any that are, most of them I have seen have a 4 dollar volt meter in them.

Tracy,
I seriously doubt if a low-pass filter is going to do any
good. The problem is what was ~not~ designed or built into the
amplifier. That is a 'band pass filter', and you won't find them
on the market, they need to be built in.
You won't find these filters on most solid-state amplifiers,
they cost a bit to make, and they 'filter' out the harmonics,
parasitics, and other trash. By doing that, the amplifier doesn't
appear to have as much output as without the filters. Since all
the 'trash' (harmonics, etc) do absolutely no good for you, except
for causing interference, and a higher watt meter reading, you don't
loose anything with the corresponding lower reading on the meter.
Basically, the change in SWR is from poor design (read cheap
manufacturor!)

Now, now Jay!

LOL! Be nice. Ole Adolph didn't exactly get what he wanted in the Battle of Britain. I'd say our British friends did a fine job of bloodying Hitler's nose in 1940 while we tried to remain "neutral". Except for sending supplies and equipment and getting our ships sunk by the Wolf Packs in the Atlantic, we refused to lift a hand until Pearl Harbor in '41. While England was, indeed, in danger of falling to Germany, they did not give up. They fought bravely and with determination under grave circumstances. And they kept Herr Hitler at bay until we did declare war on the Axis. We DID not win WWII single-handedly. The ALLIES won it. Canada won it. ENGLAND won it. And WE won it. But we did it together. As partners and friends. The way it SHOULD have been--and the way I hope it will always be. For me, Jay, as a history buff, I have nothing but admiration for Britain and its history. I have met many Brits and all were kind and friendly people. Sure, there are "grouchy" Englanders, too. But I admire the guts, the grit, and the stick-ability shown by Britain in WWII. I am as loyal an American as anybody also native to this land, but I also remember that my ancestors came from England and Scotland. Yeah, the good old USA is big and powerful, but we must remember that we cannot exist in this old world without friends.

And except for that "rahthuh" sticky little business back in 1776 and 1812, I would hope we would be able to call England "friend" forever! Jay, you're too hard on people! LOL!

A good peak and tune is worth maybe $50 at most, but I don't recommend you have your radio "clipped". That is where you get the distortion and bleedover from. I have had my radio peaked and tuned, I now put out 10W AM and about 20-25 SSB. My radio is still super clean. But make sure it is done by a knowledgeable tech. If you don't trust them then don't let them do it. Talk to some of the locals in your area and get to know them, in most areas there is someone who works on everyone's radios and comes highly recommended. In my case I found a guy called Train that everyone highly recommended and he did the work for me for like $30 I think. He did an awesome job. As far as your antenna mounting problem, you will have to build a mount to do what you are looking for. I don't think I have ever seen one. And do yourself a favor get the Wilson 5000.

WOW!, this is a bit of a shock. They were great to me last X-Mas when I bought my Wilson 5000, they were prompt and courteous. The antenna (my fiancee ordered it) was on back order and it looked like it wouldn't get here in time, so they gave us free shipping and sent it next day air, to be sure I got it in time.

Well, while most of you have pointing fingers, the question still remains. And it is a valid question, maybe not worded quite right, but non the less. When I was looking on the web for mods for my Grant I have found dozens of sites that mention clipping parts (nearly all of them), I have resisted the temptation to do any of these mods (mainly because they say to do a mod different ways, with no uniformity). So the real question is, Are mods that call for you to clip parts a good idea? Or is it just a lesson in experimentation?

I have a U-TEST-M tube tester that came out of a drugstore and i
could use some help with it .
I just took the back panel off of it to change the power cord , when
I noticed that the wire with the clip on it for the plate caps is not
connected in side the the tester .
Hopefully somebody out here can tell me where i need to connect this
wire to .

THANKS

"Valco Electronics" (valcoelectronics.com) makes a adapter mount that is called: "E-Z Over" folds over 90 degrees. Worst case I would go with mag mount. Strong wind might be a problem with this. The reason I am going with a fiberglass antenna is, from what I have been reading, a top load is better than a base load. Theory is one thing, you know how the rest goes....

Would a 5 or 6ft Wilson mounted on the front of the box, right behind the cab, with a removable mount, be a better solution. Will the cab interfere with ground plane???

Would "Peak and Tune" money be better spent for a small linear????

Thanks again!!

Clint, you may have found the only thing in the world we agree on. Either the fine audio of Radio Spain or some clipped, compressed, frequency-curved monster with about a 65% duty cycle on voice -- makes no difference to me. Nothing in the world like hearing the PTT relays and blower motors sound like an explosion in a junkyard on keyup. Set the compression so high that if you don't operate from a padded cell, you hear toilets flush for six blocks while taking a breath. Yeahhh. Just remember that God sounds like Orson Welles.

You have noise and back (voltage pop . . .)

and old outdated technology that has been passed on to the younger generation

filter and trickle . . .

smell free Gels

475 watts per cell @12 volts

15 min discharge at 1.67VPC's

No damn noise and the cost of your 16 frds of caps

and you have to have the motor running

Alternators and your still on hold

I remember in the late 70's watching for the load lights to light up on my cap bank

so I could key and watch the drain out

keep steppn backwards

you can not be be reborn

nor can old technology

what a life

and that 4 dollar volt meter is accurate

How often does one watch the unit itself . . .
I read draw volts
charge volts to each battery
and amp volts

with amp reading at the charge and amp
all on one meter in the console

the Trick to it is isolation number one . . . no noise . . no surges

number two is tolerances

finding dependable parts

one 24 volt altenator at 40 amps will run anything you can load up in
the DC world

as long as the storage, discharge rate, charge rate are maintained

I need to shut my lips PeakBoo

You know what I'm talking about been around since the late 50's and the
are hard to make run on todays quality

dollar for dollar the maul whens not counting the labor

and I can run the same system in the house on a trickle charge

On the limiter components.... On some rigs, the AMC also doubles in the receive AGC circuit by providing feedback to the receiver's fro-end protection circuit. Defeating the AMC "limiter" also makes the receiver more likely to suffer damage from nearby stations, or the RF created by the rig itself. A prone example of this is the Cherokee CBS-1000, which also comes in a number of other "flavors". The RF gain control will go out first, then receive sensitivity and I have heard cases of final transistor damage resulting from the removal of components in the AMC string. On other rigs, controls marked AMC may be interpreted as mic gain, and actually be the clipping level for the modulation limiter. If the customer is able to watch the waveform before and after the modulation mod, and keep the output signal clean and within 100% modulation, then the mod may be beneficial. However, this is beyond the realm of most customers and some repair shops.

There is still no substitute for the antenna system, and better performance can be achieved by improving the antenna system and maintaining a clean signal than can be from "peaking" the radio past the point of stability; not to mention spectral purity.

I used to clip the limiters out of radios I owned until I happened to use the scope I already had to look at the waveform of the output. That gave me enough reason to rethink my position on modulation mods. I have had better results with carrier suppression (or reduction) with limiters intact than with AMC circuits that have been gutted in the name of "more swing"

I also have a SS-4900b, and I can't imagine anyone not being happy with the potential for forward modulated carrier on this radio. Using the hand Mic that came with it, I cannot talk directly into it closer than 12" away at full mic gain. It performs well at the 11 o'clock position about 9" away, or horizontal where you talk across it at higher mic gain levels. I don't think that rig suffers in any way from lack of "Swing"

David

I sure know how high in the clouds you are lost after making that remark. if you are really banking on that sort of "manuevering around the laws", I can indeed disregard most of your retorts from here on out, you'd better stick to hop-scotch and playing candyland.

For starters, note that you used an aluminum plate to attach the magnetic mount antenna to, right? Replace the aluminum with steel and it might then work.

Interesting. As far as who pays for what, the problem, at least as I see it, is that NO ONE wants to pay for anything. Whilst our politicians make a big deal out of a budget surplus and want to cut taxes (rather than reduce debt), look where all the extra money is comming from. Cigarettes (this may not be bad, it is, however, a tax any way you cut it), sales tax (in my area, 8% - oh, I forgot, rental cars are 13% sales tax - oh yes, the hotel tax, um ... lessee ... Rochester, NY was found to be in violation of state regulations on how much property tax they could charge - they reduced it, but then added 'fees' for street lighting, snow plowing, sidewalk plowing, etc, etc. I was paying taxes equal to a house in the suburbs worth TWICE what mine was (yes, I figured in the garbage collection which is unfair since the suburbanite had to pay extra for that). Our water rates were (when I last checked) TEN TIMES what some other areas charged. Social Insecurity is a joke. Go figure. Forty years of work, most of the time paying off Social security is (in terms of inflation adjusted dollars) over 400,000 buckaroos. Sure, you'd have to subtract life insurance for survivors, but .... All I am suggesting is that every generation has continued the same thing. No one wants to pay for anything.

As far as Morse code - who cares? I learned - and used exactly one time at around 15 WPM - American Morse (not international)! I just wanted to goose the 'gummies' (the security people in the Navy) who monitored every transmission out of the ham shack. I had a good half hour to forty five minute QSO using it. It was a good laugh (even though they took the beer cooler out of the shack later).

The retesting is a GREAT idea. This should not only apply to drivers, but ham radio operators. We need to see who is keeping up on things! (BTW, PSK31 looks interesting). Gee, you wouldn't want some old codger who got his ticket in 1962 being grandfathered in by passing the test way back when, right? It was these attitudes that caused me to loose interest in amateur radio in the late '60s. I got into CB in 1970 and had a ball! But, then again, no CBer could possibly know much anyways, right? I got a bug and decided to get my tickets back in 1993 (not the commercial telegraph ticket - I had no use for it then and no one does now, I suspect). Gee - no study, no reading, no CW - I called and found out the W5YI group was giving the exam that evening (I called around 2 PM and the test was at 7). Well, I passed. And the exam was NOT 5 WPM. I also reobtained my GROL (had my 1st phone back when). No study. No, I don't use CW. Well, make that one exception. Someone was giving a lot of static on the 444.850 repeater stating that CW was necessary. The repeater owner was in the conversation. Ok. Brief 40 WPM exchange. Case closed. Hey, no arthritus, but I must admit my

fist gets shaky much past 24 or 25 on a straight key - the old HA1-TO keyer is nice, but, as I said, I don't bother with CW. Besides, the stupid HA1-TO keyer doesn't go much past 45 or 50 anymore.

I agree with you. WE SHOULD RETEST EVERY HAM EVERY 10 YEARS. No, not Morse, but we should get a teesie bit heavier with the theory.

Good reply. I would like to note that while the internet and cellphone certainly give more reliable day-to-day communications, it is exactly that infrastructure which gives them the communications advantage will also be the big disadvantage should a widespread disaster hit. We had a pretty good ice storm over the northeastern US and Canada a while back. We were shipping batteries and canned goods to the affected area. I heard they were asking for HF amateur operators up there. My mother's cousin (what would that make me what to her?), from Gouverneur, NY, was without telephone, lights, or heat for over a week. The cellphones tend not to do too well after a few days without power. Neither do the regular phones when the phone company has no power for a week or more. One of the amateur repeaters was pressed into service for the local police up in NE New York (ice took out the big communications tower). No one would argue that a bicycle is superior to an automobile, but, should we face a big oil embargo, you just might be happy to have the bike!

Yepper, and I get nervous seeing the posts (and there have been many) asking how much voltage they can run into their radio. You might explain what happens when a voltage regulator goes bad in a vehicle (the blown caps, shorted coils, blown final) ... and do you want to fix it? No. Why? Because the whole thing has been stressed and anything solid state that isn't replaced may die tomorrow - and you are responsible since you 'fixed' it. Sorry guys, toss it away and buy a new radio - or try and fix it and use that as a learning experience!

Oh, wow. Think a minute. It was designed to use the entire car body as a counter poise. Ideally you would need a piece of steel roughly 18 feet round, or you could use a much smaller piece and then attach several radials to the plate roughly 9 feet long. The mag mount antenna by itself is only half of an antenna. It is missing the counter poise. I am surprised that you had it working as well as you did given the situation.

The Rx light is on when it is powered up. The tx light comes on when
the Mike is keyed. There is a very faint static noise on the speaker
but it doesn't change with the squelch. The pa still works.
I hope thiss helps.
Thanks For your help so far.
The rckman

Oh, don't let my wishes be misinterpreted... I think it would be a VERY VERY bad idea for local law dogs to start enforcing these laws; after all, your average badge doesn't have the adequate training, education or experience to know on site what equipment is legal or illegal. And you have had run-ins with them before, i'm sure; you cannot talk, discuss or debate anything with them. Regardless of how stupid they are, they'll give you that "don't back talk me son! i've been an officer of the law since time began, I know what the laws are and what they aren't.. etc etc etc....."

I just also tend to be realistic and realize that, even if it doesn't pass this time around, it EVENTUALLY will, if for no other reason than the fact that there are those out there that love to rock the boat and make waves.. instead of enjoying the lax environment that exists in the area of enforcement, there are those that just CONSTANTLY pushes that line a little further and a little further... such as the fellow that placed his 11 meter antenna right on top of a water tower, just FEET away from other civil frequencies not to mention the police, fire, etc... and INTENTIONALLY bled all over them and cussed them, exlaiming "and they CAN'T do anything about it, either!"

>

>

> And so on. It is a very bad law. And those of you hams who are

> a-comin' to 'em with their 'leenyars' and extra channels. I'm better
> than they are, and the local law can't touch me. NaNa NaNA, Boo Boo!"

actually, we're not saying that at all... we know what the "slippery slope" is, and realize this may only be the beginning of such a disastrous adventure into new authority given to them... not to mention the fact that we'd stand NO chance trying to tell a police officer at 2:00 am that what the neighbors are hearing is an 75 meter ssb 1.5 killowatt voice transmission that is TOTALLY legal.

Ever run into one of those cops who won't even let you
> say a word, and if you do, threatens to cart you off to the slammer?

Source record: 55587

Maveric,
Try doing this. Use a steel/iron plate to set the
mag-mount on. This is just to hold the antenna in
place. On the steel/iron plate, drill 3 or 4 hole,
attach 3 or 4 wires 9 feet long to the plate. Use
bolts or solder the wires. Spread it all out on the
roof (as well as you can). Now try the SWR. Should
be down to some reasonable value, or at least can be
tuned.
Use insulated wire. Wouldn't worry too much about
~ever~ starting a fire with bare wire and radio, but
the insulation keeps things from corroding quite so
fast. The more radials (wires) you add to the plate
the better. But use a little common sense, 3-4 usually
work well enough. It would be nice if the radials
were laid out symetrically, but that's not too critical.
Good luck...
'Doc

I plan on getting on 160m in the near future and was wondering what would make a good antenna with the materials I have on hand. I have about 30 ft of Rohn 25G tower an insulated base and a 32 ft whip. I want to make a loaded vertical and was wondering whether it would make a lot of difference whether I centerloaded or base loaded it. Baseloading would be easiest but I would not mind the extra work of centerloading it if my efforts were rewarded in any sustantial way.

Receiver mod?

Shouldn't need one.

> wired for a four pin conventional hookup
> Cobra standard

The Johnson wants to see a high impedance Crystal (or ceramic) mike cartridge, but the high drive required can be accomplished by a mike amp..

The amplified mikes generally do not sound as good because their output coupling cap. can store the rectified grid current and change the operating point of the tube.

> no mods are suppose to be needed on the Cobra, Galaxy etc being used for
> the transmitter
>
> the two I have had in the past, had Browning R23's wired for them

With that set-up you were using the VFO in the Johnson to set the transmit freq..

Normally I see a Hallicrafters SX100 or SX101 or a Hammarlund HQ-180 receiver used there.

> The problem is these are suppose to track transmit as well as recieve

There are (2) ways to do that.

1) Have the VCO on the Johnson control the receive mix on the CB, or
2) Have the CB control the transmit freq of the Johnson.

> 100 dead key swinging 350 on the bird

Sounds like only average watts, not peak.

> Can't make it track and the VFO is disconneted

See choice number (2) above.

> This guy who did these did a good job from tyhe looks of things
>
> just no instructions have been handed along the chain has been broken
> Any help would be Appriciated

The CB xmit has to be switched thru a relay contact to where the VFO used to connect.

The CB transmit is now acting as the 'exciter' and replaces the VFO.

Be aware that what you are attempting to do is illegal even if you are a HAM operator because of your modification and/or misapplication of the type accepted CB.

> Brass
>
> What mics work the best on these
> I use to use a old EV
> I have a magnetic controlled Johnson (new) don't know if that will work

1818. NEW Search Engine - Specifically for CB and Amateur related searches!

Newsgroup: rec.radio.cb
Date: 2000-10-16 00:00:00 UTC
From: Karl Vesterling <kjv@adelphia.net>
Message-ID: <1kIG5.708$%J6.65598@news1.news.adelphia.net>
Source record: 55650
Cross-posted to: rec.radio.cb,uk.rec.radio.cb

Hi all, you probably remember me from all those posts about Doc's Radio Repair.

Doc now has a search engine on his site that's REALLY fast! No banners, and no BS in the results. (No commercial advertising!)

You can get to it by clicking here: http://kjv.homeip.net/~hr2510

This search engine was created because I was (and I imagine a lot of other people were) getting tired of searching for a modification for say a Presdient Jackson and having URL's come up in the search results for Michael Jackson, Joe Jacksons knitting club, and someones new pet dog named Jackson, amongst other irrelivent results.

The engine is FAST, low on graphics so it loads quickly, and delivers the results you are looking for.

Please submit URL's for indexing via email as I won't have time to add in the submit URL page for at least a week. I have taken some time to enter in some nice CB and Amateur sites into the search index so we have quite a bit of information to start with.

Try it! See for yourself.

-- For those that are about to complain about this post: (you know who you are)

This message is posted to this newsgroup to inform the readers of the availability of a resource for CB and Amateur Radio related information. This is not a commercial advertisement as some have suggested. It has relevance to the topic of discussion, there is no fee to utilize the engine. There are NO banner ads on the site, so no revenue is generated by the site for traffic, exposures etc et al.

And finally... I AM NOT DOC!

> sustantial way.

Actually, top loading would be even better. You've got about
an 1/8 wave vertical (not too good on 160, but will work, sorta').
You'd need a fairly large coil to get it close to a 1/4 wave or
longer.
Have you thought about an inverted "L"? Bond a wire to the top
of the tower and run it far enough to get something on the order
of 130-150 feet, total. That would put your matching system at
the base of the mast (hate climbing!).
In either case, start putting in a ground system now! Your gonna
need it...

Greetings!

Many "cheap" radios do quite well on their own right out of the box.
It's a judgement call.

If you wanted to know what the radio is capable of - then have the
radio checked with all the tests the tech can run, and then you can
decide if it's worth the price to have the "clip" done.

I personally would not clip the limiter - it can be modified
in such a way that the peaks are handled far better without
the distortion and excessive interference the radio can
generate.

In fact, with a little ingenuity, you can apply the mods on my
PC-122XL page for this idea, yourself. If you have the "know
how" and desire to make this work. It's not difficult and with
AM-only radios - the effects can be stunning! [Broadcast
quality]

http://www.iserv.net/~codyspc/PC122XLmods.htm - and view
the dealings, parts, component placements and the schematic
of what would be needed to make this idea work.

Granted this is for the PC-122XL - but with that "ingenuity"
you can apply versions of these mods to other radios and
actually improve the radios audio quality and quantity with
little worry of damage or generation of interference to others
using devices that aren't supposed to pick up CB radios! ;-)

It's a far better idea to see what the radio can do first, then you
can make the call on doing more for it later.

At least you can know if the radio is worth buying - it pays to "shop
around" and look at other radios and see how they perform as well.

Man, I usually avoid the hammie vs. cb thing for the simple fact that we are all people and to each their own. But after visiting that link you posted, I can say with no regret or apprehension whatsoever, the mindset there appears to be extremely callous, shallow, and snobbish! It's these types that actually do more harm than good to radio in general. Pity some will never realize it.

Greetings!

One of the techs "peek and tweek" mods may have shorted out a cap or
two on the board after those months of running "red-line" - take it
back and have them look at it.

Does the radio have a hum in the audio now? If so, the power supply
caps or a voltage sensitive cap on the main PCB is starting to fail.

The power company has an easement across the back of my property. They installed some towers back there about 4 years ago and never strung any wire on them. Wonder how much trouble I would get into if I strung my antenna on their towers.

If you have to use an exterior wall why not use a piece of 1/2" conduit and surface mount it to the outside of the house. Use a junction box with a hinged cover on the outside and you can disconnect it in the box during dangerous lightning storms, or you can use a condulet to enter through the house. You could also use wiremold brand raceway, they sell it in different colors and different sizes and also in UV resistant outdoor plastic. Just a thought.

Hey Richard,
I was curous what are the best type of antennas for 160 meters.I have just purchased a new Yaesu FT-100D and want to listen on 160.I have heard about using beverage antennas but how do u make one or is there a better antenna?
Thanks,
Mike

Best is a matter of signal to noise and that is a function of where you live. I have no particular experience with a Beverage (a man's name, not a collection of beer cans); never had the real estate - you are talking about roughly a quarter-mile of wire. My experience was with coax loops from my days in St. Louis where it was really necessary to keep the crap level down to a gentle, ladylike belch. Beverages are also directional and that seems to be a bit self-defeating for your purposes.

First off, make the investment in the ARRL antenna book and design away; don't listen to me exclusively cause I ain't that good. Just about anything will get you started listening so you can find out real quick what you are up against. Background noise is probably 30 uV in East Nowhere and way more than that in more Southern urban areas. Sensitivity is not your problem. What you will probably find is that a ferrite loopstick stolen from an old AM radio resonated with about 200 pf in series with the 365 pf you steal from the same radio will work better than what you start with. It will narrow the bandwidth enough to protect you from the local Ancient Modulation stations and a certain amount of broadband crap. Virtually any system you adopt will have some fairly strong pre-selection or it won't work. I ended up with a fairly large coax loop on a rotor and transmitted off of a hi-tower used as the basis of an inverted L. Worked pretty well but I lived close to TV towers and across the Mississippi from some fairly hairy AM stations. If I did not switch antennas, the overload and static was phenomenal. This is not likely to be your problem; buy the book.

It is also wise to pay attention to Doc. Start working on your ground system now. Fair warning, just about everything you learned on 11 meters will be wrong.

Do you talk AM or sideband? An amp for AM is more forgiving than
an amp that's good for sideband. For AM, any crappy amp will work.
For sideband, you need a biased amp and a relay delay in the box.

Use #6 or larger for a two-pill and go directly to the battery.
You can ground to a convenient location close to the box if is
a good frame ground.

A good all-around box is a Texas Star. Get a 250 if you want to
see about 180 watts on AM. The number is a peak reading.

I agree our British friends did a great job stooping the Germans, in the Battle of Britain. But the US knew a war was coming, and very prudently kept a low profile in manufacturing arms and support equipment. Supplying war materials to England isn't exactly being neutral, and not lifting a hand. We didn't refuse to lift a hand, we simply where to far behind the Q-ball to start and finish any armed efforts. War Production of materials started in and around 1938, and in some cases earlier.

> While England was, indeed, in danger of falling to Germany, they did not

> mination under grave circumstances. And they kept Herr Hitler at bay
> until we did declare war on the Axis.

No I must disagree with you here. The German Navy was never any match for the British Navy. The German effort to invade England was called off due to the German war planers, believing they would get their a$$ shot off. So this drove the invasion of the USSR.

But the German intel boys knew that American war supplies where pouring in by significantly increasing tonnage. And this added to the German desiccation to not invade England.

We didn't declare war on the axis, we declared war on Japan, the Germans declared war on us. Stupid move, on the Germans part.

No this wasn't just "rahthuh" sticky little business, either. This was a
great piece of history, that showed that a United States could beat the
Kings Army of Terror and Tyranny. The sprit of 1776 lives on.

Perhaps you should look that up next time while having Tea.

1856. Re: 2 Questions: Peak & Tune, Antenna Mounting

Newsgroup: rec.radio.cb
Date: 2000-10-16 00:00:00 UTC
From: Maveric <maveric169@hotmail.com>
Message-ID: <8sg6i0nse1@slb3.atl.mindspring.net>
Source record: 55688

Hello,

The cab of the truck will cut down on the antennas transmit and receive range in front of the truck, As far as the "E-Z over I would just manufacture a locking device "like a pull pin" so it can't fold over unless you pull the pin, a little bit of work for you but it could solve your problem. As far as the peak and tune money toward a amp, it will more than likely out perform any tune job to the radio, but you will want to make sure to have the amp matched to the radio.

Hi Gang
I have a 23 channel Johnson Messenger 191.
I don't have the Sam's on this one and need to know
how to get this thing on frequency. It's 2KHz low on
all channels. It has a pll and I have already put
extra channels on the anl and pa switches but it's
off frequency. Anybody help?

Hello all,
Are any of you station operators out North Dakota?

I used to have my station in Aneta, ND (northeastern corner of the state).

That was from Nov. '94 till March of '95.

Shot a lot of DX that winter... got a lot of cards.
I was known as North Dakota unit#974.

Anyhow 73's,
NW000 Minnesota

Agreed... Retesting is a good idea.

How I got My Ham Ticket? My friend John had asked if I wanted to get into Packet with him. I said yes. One sunday morning at about 9:00AM John N2VQJ shows up at my house and says, "We're going!", "Going where?" I asked (last time he said this we wound up getting upwards of 6000lbs of DEC Vax 11/??? series equipment in Athens Ohio.) John replies, "First to breakfast, then to take a test!". I asked, "What test? It's Sunday!". John says, "Get in."

After a breakfast at the local Perkins and plenty of coffee we start quizzing each other on the test. John had the book o' regulations from Radio shack and we quizzed each other for about 45 mins. Now you have to keep in mind, John and I are software engineers who (at that time) would bang out complete packages in 47 hours straight!

Then we went and took the test.

Both passed, no problem!

I think that the classes of license should be based more on the theory and electrical engineering aspect rather than the morse code. In other words, if someone can build a radio out of a piece of quarts, some copper ore, and using only candle wax as the insulator then by golly they obviously know the theory and concept. (radio folks, not metalurgy - hmmm, kindof reminds me of the professor on gilligans island!) But I hope people get my point rather than make comments about the humor aspect of the post. - Oh, what am I saying, this is the CB forum!

On 160 getting it on the air at all is the first step. Baseload it and be done with it. You have more than a quarter wave on 80 and that is one hell of a lot more than most. You are very close to having a Hy-Gain Hytower as it sits -- you might want to look at one of those for ideas.

Couple of thoughts from the days when I had the space to do it:

1. Standard rule was always transmit on a vertical, never listen on one. Learn about shielded loops for receiving. Man-made noise is largely vertically polarized and with the antenna above dc ground you will hear every thunderstorm for 500 miles.

2. Realize that for antennas, 160 is wider than CB, freeband and all. You will retune a lot. Sharing the problem with a tuner avoids going out at 3AM in the snow to move the tap on your loading coil.

3. While there are no regs on usage in the Gentleman's Band there is a bandplan that will keep you from being looked upon as a major lid. In general, the CW/RTTY/Digital guys hang out below 1840 and the 1830-1850 area is the DX window. Back in the days, those who had converted old Marine AM gear (went SSB in 1972) hung out on the high side. Suggest finding someone more knowledgeable than me on later developments.

4. You are aware I am sure that there is a good reason why Ancient Modulation stations tend to be built in swamps. At the very least, provide a good current-sink at the base of the antenna, something like a ten-foot hexagon of ground stakes (use old conduit for cheap) all wired together with a random radial or two (or three, or four up to 120) in favorite or possible directions.

5. You may want to, depending on your real estate, simply tie a wire at the top of your tower and run it out until you get resonance at 1900 or so. The

neat name for this lashup is 'inverted L'. It is really, of course, a top-loaded vertical with a bit of directivity.

6. Be prepared to lose a lot of sleep. Top Band is for insomniacs on cold winter nites.

Enjoy!!!

Dick N0BK

Source record: 55700

the main problem I find is that the customer doesn't know or understand
that a good clean signal is better than a 0vermodulated distorted
signal..... every week they come to me saying there buddies say they
don't have any modualtion.... I try to explain that they have 100%
modulation but don't have any distortion.... .....Well distortion
is what they want!. and if you don't give it to them then all of a
sudden yoyur a quack, don't know what your doing...

as bad as I hate it. you gotta face it....clean signals don't sell.
and thats the down and dirty truth.

Mark Twain in his Nevada newspapering days made two attempts at humor he
regretted for a lifetime. One was a tug on local officialdom that involved
the discovery of a petrified man over which (or whom?) they held a coroner's
inquest, etc. and really went nuts. If one read the story carefully the
stone man was sitting cross-legged, hand vertical with left thumb to nose
and right hand in line with the left. Twain was getting inquiries from
learned professors for thirty years thereafter.

I suspect you have come closer than most to knowing exactly how he felt.

James, yeah, I definitely didn't rule in the aspect of a natural disaster. As far as an oil embargo, plenty of natural gas here to go around. I was in London UK while they had the big gas strike. That was interesting to watch. But you know what, rather than having to deal with the symptoms of being dependent on one particular source, wouldn't it be a good idea to diversify the consumption?

Oh, power... Yeah, got plenty of water going over the falls up here. No need to burn plutonium or petroleum here. BUT an ice storm could really mess things up!

But, A natural disaster, yeah... That could cause a problem for a lot of people.

Bike?? Nahh, I'll take a horse if it gets to that! Horse can keep ya warm, fuels itself, etc... I would argue that horse is better than bike. Espeially for pulling things.

An oldie, if not a classic radio. Another example of a "ham" radio, that was really intended for the freeband market. It had 11 meters in it for "receive" only, however an easy mod allowed transmit as well. Had the CB channels marked (at least the first 23). This radio was "interesting" to operate to say the least. If you were a hard core SSB user, the radio worked fairly well. Audio quality was good and it would do 100-120 watts out. Now for the bad news. The rig drifted quite a bit, especially if the band switch was dirty. A freq. counter is a must when using one of these radios. Many people that had them, used to keep them powered 24/7 to minimize the drift (which was unacceptable for SSB use). The rig has an "AM" mode in it, but it's not a true AM. The receiver was still in SSB mode, which meaned that you had to zero-beat the other stations transmit carrier, to make for a clear copy. AM transmit was equally poor. It was still in SSB mode, except for a deliberate unbalance of the carrier balance circuit, which gave it a carrier for AM. It was very easy to over drive the carrier, and the audio would mush up like an SSB signal if the audio were overdriven. It was definitely not a good rig for AM, especially if you're a fan of loud audio.

>

Well, you have a bit of a problem. When 23 channel radios were "in
vogue", the usual SSB channel was 16 (upper and lower). Sometimes,
depending on your area, channel 17 and 23 were also used for SSB. But
when the 40 channel radios came out, just about all SSB activity moved
up to channels 36 - 40. There is likely no remaining SSB activity on the
lower 23.

You could swap out one of the synthesizer crystals (1-4 for example) and
replace it with one that gives you 36-40. But that is probably more
trouble than just picking up a decent second hand 40 channel radio.

>together.

Absolutely. These power supplies are bullet proof.
Very technical and very safe for any equipment you
have connected to it.

The ones I have are "power inhibited" meaning 5v needs
to be applied to the 6 and 7 pin of each module in order
for the power light for each module to go from red to green.

ASTEC sent me a tech sheet on how to reverse this for
each module.

I've had great dealings with Bill's 2 Way, every time. I'd stay away from Copper, at least when buying radios. I've ordered a few accessory items from them, and those deals were okay (their operators are ditzy as hell though, and kinda rude) but their radios are questionable at best.
Try Bill's, he's honest and has good prices and great customer service.
Linus

I dunno about that. By using low power transmitters you can simulate bad propagation conditions when there are good propagation conditions. This might improve your operating ability. Amateur Radio was never meant to be as predictable as commercial broadcasting. Heck...Whats a few dB down to most real Hams but a challenge? The Ham who becomes obsessed with QRP, like the obsessive porno watcher, may spend lots of entertaining time without making any real contact. To each his own!

Hams need more license classes ans/or technical endorsements.

A note from a dealer on this.
I always liked the RCI-2950/2970's.
However they had some oddities. Some worked very well for many years, some worked hardly at all. Most of the problems on these could be traced to poor soldering of the main board. I can not tell you how many times I fixed these by resoldering a section of the board. I guess to many would be the correct response.

These New 2950DX series radios have a totally new board. Surface Mounted parts, and coverage from 24 to 30+ Mhz. They seem to have fixed up the final section, and have better output than ever before. Now, I have no way to say if thes will outlast their older models. But: at first glance, they seem to be better assembled then the older ones.

1892. help with tester

Newsgroup: rec.radio.cb
Date: 2000-10-16 00:00:00 UTC
From: BENZ302@webtv.net
Message-ID: <425-39EB222D-3@storefull-127.iap.bryant.webtv.net>
Source record: 55724

I have a U-TEST-M tube tester that came out of a
drugstore and I could use some help with it .
      I just took the back panel off of it to change the
power cord , when I noticed that the wire with the clip on it for the
plate caps is not connected in side the the tester . There is a steel
can about 2" in diameter and 4" long inside the panel and it surrounds
the hole where the wire enters the panel . (It seems like its there to
protect that loose wire from touching anything) The wire is stripped
and tinned for about a 1/2" , but it doesn't look like it has ever been
soldered to anything .
I know that these drugstore testers weren't the greatest . Is it
possible that this wire isn't supposed to be connected and it was just
put there to make the customer think that he was testing it properly ?
THANKS
BENZ

Well, alright, we are getting somewhere with some decent dialogue and not a soul has come in and name called or cursed.

I'm really not clear on your opinion of local enforcement. Are you saying the majority of local cops will enforce this correctly? I beg to differ, whether it is through sheer ignorance or pure malice on the cop's behalf, I feel the majority of enforcement by local authorities (assuming the bill passed) will be one major clusterf***! Innocent folks will be harassed, and if even ONE person is wrongly subdued, detained, searched, whatever, it's too many.

I'm not apathetic about voting. I have voted in every election since I was 18, I'm apathetic toward the PROCESS.

<<what if everyone did it?>>

I have the utmost respect and admiration for those who take the courage and stand up against laws they do not believe in or feel unjust. I wish everyone WOULD do it. If everyone did it, we'd effectively and collectively nullify half the lousy and impractical laws in society that serve no purpose except to benefit the elite minority and moral majority.

AM vs. sideband? I like both. Each has it's finer merits. Curious though, you do talk sideband, but just local? You do not violate the 150 mile rule? I understand if you don't want to cop to that here...with my paranoia, I'd guess the possibility exists it could come back to bite you in the ass someday, if the DX police come knocking, or, if you decide to run for public office one day, someone brings up your "lawbreaking involving Federal communications".

If they do happen to treat radio operators in violation anything like speeders, the law is useless. (I feel it's useless anyway, but here is another reason that validates my reasoning) I have a very close friend who is a motorcycle enthusiast. He is also a speed demon, and I do not mean drugs. Fortunately for him, he is also very well off. We were on a camping trip not too long ago, he was driving (we were in one of his cars, a Volvo) and we were on mostly back roads. Upon entering a small community, there were signs posted, "Speeding fines doubled", and the damn fines were posted on the sign itself. I pointed out the sign and he did a quick calculation and all he responded with was, "I can afford that", and he slowed not one iota, keeping our speed at around 70 mph, when the posted was 55, and entering the little town with one flashing light, the posted speed was 45. I shrugged and told him it was his wallet. He has an entire room in his house literally wallpapered with speeding tickets from his bikes over the years that he is proud of and

displays with hardy enthusiasm. His wife gives him hell once in awhile, but he pays his fines, his outrageous insurance, and has had his license yanked a few times, but it was always for speeding. Someone like him gets into radio and runs a box, gets fined, confiscated, etc..No problem, pay the fine and buy another box and radio. To these type of guys, it's the rush of certain illegalities that gets them off, and if they can afford it, so be it. Not saying it is necessarily correct, but that is the way the law is. Keep paying, keep playing. That, unfortunately, is a real possibility with this law being passed. I doubt anyone is going to prison for DX, even freebanding or linears, unless wanton and/or repeated malicious interference is caused. Hence, the fines...and those who can pay, will continue to play.

Hey Dave (or Deb), Out of my current lineup, somewhere in there is a Northstar....9500 I think. Other than frequency drift, which this sucker has, but stabilizes somewhat after it's been on awhile, what can I look forward to on this radio going "Pfffft"? Had it for about 2 years, bought at a ridiculously low price, and no problems. It doesn't measure up to my other radios, not even close. But what can I expect in the future from this "commie" radio?

they are the Plate tune and Load controls for peaking out the tube type transmitter. if they are not tuned right the tube will become very hot and possibly burn out...(however the old 6L6's they use are pritty tough tubes)

I'm in need of suggestions on how to route my antenna cable from my attic to a room on the first floor. Ideally, I would like to route it behind the drywall and install an outlet box in the wall with the proper connector. I purchased some fish tape and began to try routing the cable but ran into the supporting 2x4 after a few feet. Anyone know of a good way to route this cable?
Thanks,

Greg

With little fanfare, the FCC created the Multi Use Radio Service on July 12th. Its birth went just about un-noticed everyone except those in the telecommunications industry who fought long and hard to see it become a reality.
Lots more in full article...
http://www.qrz.com/articles/00/10/15/1215251.shtml

MURS is really a new kind of license free Citizens Radio Service, but one not subject to the vagaries of high frequency propagation. This is because Murs operates in the 151 MHz spectrum -- not far above the two meter ham radio band. But unlike 2 meters, the Murs service is expected to be filled by everyone from hobbyists to commercial users all vying for local communications that is virtually regulation free.

Unlike its predecessor the micro-power Family Radio Service in the 460 MHz band, MURS permits users to run up to 2 watts of effective radiated power. There is no restriction on connecting external antennas to a MURS radio as long as the 2 watt effective radiated power restriction is observed. Also permitted will be phone patching, paging, telemetry and remote control operation. In addition to voice, the FCC is permitting Murs users to transmit packet, data and imaging.

Are you trying to do this on an exterior wall? What part of the country are you located in? I ask this because building codes change in different areas and it easier to assume on how the structure is built. Some houses contain fire blocks. This is a 2x4 between the upright studs to keep fire from spreading up the wall. It can also be in the wall for strength, it all depends on the local building codes. One Thing is for sure. If you do get the cable down the wall I would not use a bulkhead connector I would leave enough cable to get to the equipment being used. Ground all equipment to AT least on 8' foot ground rod and keep in mind that you are giving lightning a direct path into your house. Instead of using the bulkhead connector in the house use it at the base (or within reach) of your tower and unhook it when not in use. Good luck

Hate to burst your bubble RH, but I have no desire to be the new sheriff in
town!

You can keep your title!

And I am not here to POLICE the newsgroup, especially the professor.

I just happen to love electronics, and have learned a lot about hardware in the
last 45 years.

Most of that knowledge was obtained in the last 10 years or so when I finally
began to understand how it all comes together.

I have finally gotten to the point where I feel I may have something
constructive to add to this newsgroup and I will try hard to do that.

It just happens that the professor gives me more opportunities to add some
constructive criticism than most.

I think ALL of the subscribers to this newsgroup have had opportunities to
learn something new because of my public diatribes with the professor.

Especially ME; when I have to hit the books to make sure my statements are
correct in my rebuttals to him.

I consider this Newsgroup to be a forum where we may all have something we can
add to any intelligent conversation or debate, (as long as we don't have to
resort to vulgar language, threats, or name calling).

I would hate to see anyone be afraid to post their ideas on this newsgroup for
fear of being corrected, or made fun of, because when that happens we have ALL
lost either some valuable input, or possibly the source of a thread that could
eventually lead to some valuable input.

Let's NOT pick on those less knowledgeable or experienced posters just because
we may have the ability to correct them..

Let's just be glad that we have obtained enough knowledge or experience to be able to correct them; and that we were given the opportunity to share that knowledge not only with the with the poster, but with the dozens of others out there who didn't post but also needed the same information.

Those same posters that you shared your knowledge and experience with this time may have some unique knowledge or experience that they can share with you later.

Then that type of open information exchange occurs, we are all winners.

So thank you professor, for providing me with so many opportunities to share some information.

Regards,

#12

In most cases, NO....

In the 667 you are usually limited by the drive available from the 2290 stage and the fact that the DC power is 'shared' by both the driver AND the final amps..

I have seen a few that went that high, but the most accurate answer is NO.

You know, I have heard this from so many sources it isn't even funny. Anyone care to shed some light on why Copper is frowned upon so much, other than customer service? I agree that customer service/switchboard operators, or whatever they use are severely lacking in knowledge of almost all aspects of what their position SHOULD entail. And the subscription thing..well, that is self-explanatory. I understand plenty of dealers badmouth Copper, also. But I have heard this similar complaint from many folks who are NOT dealers, as well. I have always advocated supporting the small dealer, for reasons of my own. I personally have bought a few things from Copper (no radios) with mixed results, and any complaints were mainly due to customer service, but to the consumer, I have found that on the average, one would gladly pay a little bit more for a radio to get that specialized and hassle-free personal service and no hassle warranty. By the way, Linus, where have you been keeping yourself lately, or are you just bagging sand?

Greetings!

You have my sentiments.

It's not easy is it? :+<

I usually [SIC] modify the ALC/AMC detection circuit instead of just
the plain old [Snip] here and there. [Unless it's the absolute request
of the user/operator, and at that point on, they're on their own...]

Too much bad luck with people that use Power mikes on radios that
should, and do, sound better with a stock mike.

No arguement here, just my empathy.

There are ways around problems like that - and I hate to see you get
caught in the middle, like you are the fault.

In fact, I commend you for at least making an honest effort to display
yours, and a manufactuers, desire to operate the radio within it's
design.

On Sat, 14 Oct 2000 13:06:08 -0500, while the modem was pondering it's

greg,
Depending on how long a run it is, how you would have to
run the cable(s), I think you would be better off to make
the run outside your house, to your operating position,
maybe come in through a window.
It sounds like you live in a multi-floor house, if so,
going from the attic to the first floor can be a real
'pain', it just won't be easy. Following A/C or heating
ducting is one method. Having to follow room contours to
'hide' cabling will make for a ~very~ long run and may not
be worth the trouble (lots of loss).
If you aren't using one, a ground point where you enter
the house is a good idea. Think big when installing a
ground for lightning protection, normal size wire isn't
large enough for much protection (actually, none).
Good luck with it...
'Doc

> Please HELP!

Tim,
Grounding the A99 isn't for 'reception' benefit, it's
for lightning protection. Grounding should make little
or no difference in what you hear.
If the mast is multi-section, and each section is bonded
well to the next, a ground wire from the bottom of the mast
to a ground rod should work okay. If you extend the mast
sections and put a nail through the holes to hold them,
you really don't have a very good electrical bond (everyone
does it!). At least make it a very large nail!
Insulating the A99 from the mast isn't the 'best' idea
in the world.

It can be done without any insurance or inspection problems.

Use a metal chase and seal with fire calk.

Louis

It is! You could also use a metal chase to provide a non plenum air path through the duct.

Several used the 5104 PLL chip, which is very modifiable. The Sears and JC Penney rigs were actually capable of being pretty hot rigs, I used a Penneys' 6241 for a lot of years and always got good results out of it. These can be picked up for a lot less than other "name" rigs, and can be a hell of a deal if you get a nice one.

CJ Jeff wrote in message ...

Source record: 55599

peak and tune is not worth it , just causes lot of distrotion and bleedover for a little amount of watts .

wilsons don't flip down , they unscrew , and can be cross threaded

mag mount would be the easiest , but it will chew up the paint .

the antenna is the work horse , a good antenna will do more than a peak and tune . k-40's are ok , wilsons are better , president antenna are best , in my opinion .

ok, I also have a 2-240 amp alt system with cap banks (24 3600pf caps at 35 volts) and that is where I started, but it drew that system down to 12 volts so I took it off, thinking something was wrong with the alts and placed it on my driver system (16 volts 8 8volt batteries) and the 5 pill on the stock 12 volts, and it still draws big amps and drops the charging system down.

You are absolutely correct. I would hasten to point out that it would
be great (but unlikely) if the CB and ham community could come together
a bit more - the reality is that the CB community outnumbers the
amateur community quite a bit - and that CB set many hams put down
likely has more range than a handheld if no repeater is up. That
aside, your point is VERY WELL made. Experimenting with hardware will
not likely help you land a job, nor even help you in classes in
college. The computers, of course, can. I am pretty fair at
electronics, but the reality is that you buy the box (or robot) and
simply connect it at work. The days of leaded components is over.

Everything is surface mount technology - and a lot of that is application specific itegrated circuits. The real engineers today are physics majors who design integrated circuits! I find, however, that my self-training with software has helped. Writing / modifying PLC programs to increase productivity and reduce scrap is actually fun. I am currently writing Visual Basic programs to do some programming which has been done by hand. It is fun, but the radio and electronics (outside of college) does not factor into any of the equations at all.

Love it myself. I choose AM over ssb, but that's because i'm more into
quality instead of quantity; not that anything is wrong with ssb, it's
just fine. It travels further due to it's effeciency, I just enjoy old
tube-type plate modulated rigs that, when tuned up and fired on AM,
sound like the voice of God.

> Interesting analogy, concerning the speed limits and power rule. In

You
> never speed, huh?

oh, I never said I didn't speed; but, along those same lines, i am also
admitting that if I am caught going over 55 in a state with that
restriction and I darn well know what the speed limit is, I have to pay
the dues, as they say. I won't gripe to the judge that the speed limit
through his little podunk, backwoods, outdated jurisdiction is
antiquated. He'd surely up the fine or whatever punishment he was about
to bequeath to me. It would be my fault, soley and nobody elses.

The same applies to my radio use. I am not
> willing to pay huge fines for splattering the spectrum with a
gazillion
> watts, so I don't do it. But should it come down to me getting popped
> for telling someone in another state to have a good day, well, I am

as long as you understand the consequences, just like speeding.
It's just not the correct forum (a courtroom) to express your
thoughts..... the voting ballot box is.

>

> Never said that the laws are flawed because of who are enforcing
them.

I assumed that simply because you disregarded the whole issue of local
cops enforcing the FCC's laws because "some are bad and would abuse the
power".

To make a blanket statement that
"one
> might as well disobey all laws" is simply ludicrous and stands on it's
> own as a perfect example of absurdity.

no, that was taking your argument to it's "logical conclusion"... if you
can simply disregard ONE law because, according to your oppinion, it is
wrong for one reason or the other, than think of the logic involved;
what if EVERYBODY did it? there would be chaos. I mean, EVERYBODY
wouldn't ignore ALL laws, but everybody would ignore SOME laws here and
there, and the sum total would be total havoc.

>
> It sounds like you tend to agree the cash will not be allocated. No
> cash, how will things change?

I agree it won't be allocated because I know how governements tend to
work..... but they don't always wait for the money before doing it. Look
at desert storm. They would probably just send out paperwork to state
and local agencies informing them of the new jurisdictions, the
guidelines, etc... much like when the state governements pass new laws
and have to pass the information down the the local agencies charged to
enforce them. Probably won't be much training involved,
unfortunately..... try to explain to a local idiot cop the difference
between an illegal 11 meter amplifier and a totally legal HF ham
amplifier... or the fact that you have a 100 foot tower and it's legal
on ham, but all he knows is the 60 foot rule for cb's.. etc.
Unfortunately, local law enforcement doesn't recruit it's ranks from the
intellectually elite of the nation *snicker snicker*

>
> As far as voting to make a difference, until the entire electoral
> process is done away with, or at least revamped, and other parties are
> given equal treatment, your vote, and mine, do not mean squat.

oh, we'll never agree on that, I won't even try. I will say this. Apathy breeds discontent, because due to it's own nature, the opposing voices that DO pull a ballot lever win.

Have an old PLL02A SSB rig, have just modded it for 26-28Mhz, need information on how to unlock the clarifier for a 10Khz slide, or a switched 5 Khz jump/drop. Anyone help with the mod. I beleive that all Pll02A boards were all similar. My radio is a General Electric (A) model, single board model....if that helps.

please email all replies to maitlo:javelin@nss.aunz.net

Thanks guys

Hello

Very soon I shall be purchasing a 23 channel SSB CB. I've never had a SSB radio
but have decided to purchase an old radio just to get my feet wet as they say.
If I like SSB I shall invest in a 40 chanel in short order.

Can someone please tell me what are acceptable ssb chanels for the old 23's?

Thank you
Have A Nice Day.

A Buddy of mine has one, the DX model, goes from 24-32 Meg. pumps out about 45/60 watts. This is the best radio (audio) that I have heard for ages. He is very happy with the radio...

If you are thinking of purchasing one, do it...best money you would have spent on radio, the 2950 - the radio that other companys fail to emulate...do it man!!! JUST DO IT!

Here in Australia, from channel 15 up. You'll find out what is acceptable, once people start complaining.

I hope you enjoy the radio, I have been on since 1974, and still enjoy the hobby...

Take care mate.

There are a few mods where you can get some valid improvements. I am pretty sure there were a few designed to be modifiable. An example of this is frequency expansion. A lot of of them are for those with peak reading watt meters who like to watch the meter dance. For years people modified there radios for less Peak power and more Average power. Now it seems the tide has turned. For example: the purpose of ALC is to concentrated modulation where it does the most good by getting rid of the practically useless modulation peaks. In a modified radio this is usually the first thing to be snipped. Makes the meter read more though.

1945. Re: Power supply for CB

Newsgroup: rec.radio.cb
Date: 2000-10-16 03:23:02 UTC
From: hamm4fun@aol.com
Message-ID: <20001015232302.25693.00005110@ng-fi1.aol.com>
Source record: 55622

I have tried adding capacitors to the output of a computer power supply and it did not work so well. Apparently the power supply sees this as a short when it first starts up and then shuts down. If you have this problem perhaps the caps could be initially chrged through a resistor then the resistor bypassed with a switch.

: call for you to clip parts a good idea? Or is it just a lesson in
: experimentation?

Let's put it this way. Manufacturer's of radios are cheap - they like to keep the costs of the products as low as possible.

So if a part is there, it is there for a real purpose - not to just make the radio look more impressive inside if you open it up.

If you clip a part, then you are defeating the purpose for which that part was used. This may cause the radio to perform in a manner for which it was not designed - and may make it's operation illegal. Modifications to increase the modulation are an example. The end result is generally a signal that is more distorted than you would have with the unmodified radio. Use of a power mike does the same thing, but you have the option of turning it down so that it is not causing distortion.

Another popular modification is to increase the "swing" of your signal. If this is not done correctly, the result is drastic overmodulation - with the splatter that this causes. To some people, this is acceptable - others will not tolerate such lousy signals in their own transmissions.

I agree with Jeff. I got one that was just a monster and I have had some in the past there were fine. The last one I got I couldn't get the IF to line up. Noisiest danm thing I ever owned. Sold it to some kid out there that was dying to have a 2950. He buys and sells radios so much I figured it would be out of town soon. Sure enough I haven't heard it and the kid has another new radio.

I would get FRS radios then - same distance lower power, batteries last
longer and you can get them for about 30 each without the PL tones

Everyone needs to own one of them; to restore perspective.

8950's are very expensive to replace.
The D model was crystal based for less drift (note: did not say no drift)
with care balance of carrier level and mic gain, they could be understood on
AM.
Shure CM554 mic nearly a must
Operation without a frequency counter could lead to a Waltz across the band
on a QSO that lasted more than one exchange.
Looks good sitting on the shelf if you are beginning to collect older rigs.

>

Bad cap bank, and dead 8vdc batteries. I had the same problem. Not enough amperage storage for your rebuilt 16# maul. I had a 8 and a 6vdc Interstate Marine battery set-up which was suppose to be for the driver off of one Amptek 200amp alternator. You should've seen the Volt meter back swing like a Bird. EEEEEEEEEEEKKKK! I got smart.

I run at least (6)8vdc GELCELL batteries (3 pairs, two tied in together charging off one alternator, same for another two, into the last two into the final) running from two 200amp Amptek Alternators giving me a charging voltage of 16.4+/-.2vdc drop at the amp. I don't like the drop but as long as it is at a minimum, I feel its alright. Especially off a DX3200 driven with a 5pill 350wrms at the driver, and 1800wrms at the final. Its doing what its suppose to.

Try re-doing your charging storage circuit. Maybe you need newer stuff. Just a thought.

: Very soon I shall be purchasing a 23 channel SSB CB. I've never had a SSB radio
: but have decided to purchase an old radio just to get my feet wet as they say.
: If I like SSB I shall invest in a 40 chanel in short order.

: Can someone please tell me what are acceptable ssb chanels for the old 23's?

In many parts of the country, SSBers try to stick to 36-40 or 37-40. The
lower bands are avoided because of all the splatter from overmodulated AM
stations.

Yes...it has a switch to select between the 10 and 11 meter bands. Yes... the channels ARE indicated as well as the frequency on the VFO. SSB audio is FANTASTIC with a Shure 444 (Siltronix CM-17L) mic. The rig with a good 8950 final tube will do about 100 watts on SSB. These radios simply KICK-BUTT on SSB!! I've had mine for 25 years.

Sigh! Hey guys, I thought this was a CB newsgroup.

The reason I am asking about small handheld cbs is because there are
all these people out there who only have CB radios and I need to talk
to from time to time and it is not practical for me to supply them
with FRS.

So does anybody know if there is a cb unit smaller than the midland
75-830?

John

From: Tim Christiaens <timinvancouver@direct.ca>
Message-ID: <54aous0t9plor2emp98vljt7k0j04idn8q@4ax.com>
Source record: 55873

Quickly read an article by someone which recommends using a Firestick
II antenna as the top section to improve the Antron's performance.
First does the Firestick have the same threads to screw into? secondly
did it improve both the reception and transmit? What if any was the
result with the SWR reading? did the Antron need re tuning? Very
interesting article I read, wish I would not have deleted the message.
Please answer if you have tried this and any info is appreciated.
Thank you in advance.
Tim

1964. 62.5 AMP DC Power Supply - cheap

Newsgroup: rec.radio.cb

From: VS3 <Supply>
Message-ID: <d4rous4153t2kqp9q3ucphpmjsgv3tn205@4ax.com>
Source record: 55874

Email Address Is Below !

Brand New ASTEC:
VS3-K0-K2-K3-00
Single Phase 85 - 264 VAC /// 47- 440Hz Input
Three terminals for output:
one 2v @ 150amps
two 5v @ 150amps
three 12v @ 62.5 amps - For Ham & CB Gear

Detailed Specifications On Power Supply:
http://www.astec.com/products/1150.astec.pdf
(Must have Adobe Acrobat installed to view)

This page show a different model for sale:
http://www.newark.com/
Search for "manufacturer" part number and enter "VS3"
for other models then use the PDF (Adobe) specification
chart to compare output watts / amps.

One example is a VS3-C6-C6-20
which is VS3 or 5x8x11 case
Terminal one is "C6" which is 28v @ 32.1amps
Terminal two is "C6" which is 28v @ 32.1amps
The unit on that page is about $2,000

I'm selling this for $120 UPS Shipped

Whenever you hear someone tell how great the Firstik retrofit is you can usually immediately tell how much BS there is to it. Even a multisection Collinear would not have as much improvement as the reports you hear about the Firstik.

The odd tube in that box is supposed to be a 6JG6A , It's the driver
for the 6LQ6's .
the owners manual says it should do 190 watts , but I think thats
dead key , I would guess it should do between 300 to 500 watts on the
swing .

four 811
> tubes limits?

The 811 has 65 watts of plate dissipation so you have 260 watts available assuming your amp can move the heat out of the way. So 500 rf watts is all you can ask for. Remember that Ancient Modulation varies from 100% of carrier (no mod) to 150% of carrier (solid tones) so I wouldn't load it beyond 400 dead carrier.

Seems like a lot of effort for one S unit and kind of an expensive way to heat the shack.

Greetings!

Only if the AM regulator has failed before and weakened this part, or someone applied more voltage than they should.

If the leads are discolored, take the part out and use a diode/transistor checker to see if it's really bad or not.

A replacement part 2SB1035 - but the lead pinout is reversed so the half-moon orientation shown on the board is incorrect. You reverse the orientation opposite shown on the silkscreen and install the newer transistor. The 2SB525 and the 2SB1035 are the same - just the newer part the lead pinout is reversed.

On Tue, 17 Oct 2000 03:31:27 GMT, while the modem was pondering it's navel, rckman@my-deja.com dissertated the following:

>Is it typical for q33 to fail on this radio? is there a better
>transistor that I can use? The transistor is a b525. The legs of this
>trans looks discolored. Does anyone know what might have caused this?
>Thanx,

Yes , and you can pay a $100 dollars extra for the amp, compare that to other comparable amps out there ... so for that $100 you have a limited lifetime warranty
just think that extra $100 you spend can pay for all and I do mean all the parts inside the amp 2x over and still have some change left ... If you like I will list all the parts and there respective prices so you too can compare

Naw, it will just get a lot of color dot business band hardware out of warehouses and earn some FCC types post-retirement positions as AVPs in charge of good but not great ideas at the manufacturers association. Has exactly nothing to do with ham or CB except that making it CB did away with even minimal licensing.

Never attribute to conspiracy what can be adequately explained by stupidity.

Don't know how you figure on getting this much power out operating it as a linear amp. Unit at best will be 50% efficent. These tubes are usualy rated for 200 watts PEP per tube in linear service(50 watts on a dead key). You can push them to more than this(250PEP) but expect shorter life. Operating them as a grounded grid amp it takes about 12 watt PEP per tube to drive them so you can expect about a 12db gain. Not bad, the guy on the other end should see at least 2 S units gain and will definitely hear the difference. You need about 50 watts PEP to drive them. This means about 12 to 15 watts of normally modulated AM. If you have a swing mod "who knows". You can try pushin it to 500 watts if you like but the guy at the other end will not hear it and the tubes will not last. On the other hand I have a homemade 811a amp 15 years old and is still on its first tube. 4 watts in 50 watts out.

Is the Galaxy Elite 250HD any good? I will be using it on SSB, so I need the relay delay switch....does this thing have it? Also, I run a RCI-2950 - stock power levels. The radio sounds fine as is - so I didn't have anybody play with power. Barefoot, the radio is really clean, and I would like to keep it that way and add a couple hundred watts to the signal.....any more comments?

Scott.

There should be 2 crystals that are alternately switched to mix with the PLL output for transmit and receive.

The transmit crystal is either off frequency or has a tuning adjustment that needs to be tweaked.

I should have clarified my note. Four hundred watts, yes, as INPUT based solely on plate dissipation. This puts us in the 200-250 out range which, given that the Ranger is capable of 65 or so, is at best an S unit. The above comments are right on. Old habits die hard.

Tim,
There are some things you want to take with a grain of salt. If
substituting a helically wound top section would improve their antenna
so much, don't you think they would do it them selves? Sometimes
there's a big difference between 'perceived' 'gain', and actual 'gain.
The trick is telling them apart...
'Doc

#12's rules for grounded grid (tube) linears on AM are:

1) Dead key at 1/2 of the plate dissipation and
2) Peak at TWICE the plate dissipation

Given = (4) 811 tubes with plate dissipation's of 65 watts each, operating in a grounded grid amplifier.

Since grounded grid amps are typically only 33% efficient on a dead key and 66% efficient on peaks, we should be able to calculate the input power.

65 watts (plate dissipation per tube)/ 2 = 32.5 watts (#12's rule for dead key power per tube) | 32.5 watts X (4) = 130 watts (#12's rule for dead key power for all (4) tubes).

65 watts (plate dissipation per tube) X2 = 130 watts (#12's rule for peak power per tube) | 130 watts X (4) tubes = 520 watts (#12's rule for peak power for all (4) tubes)

Since grounded grid amps are about 33% efficient for dead key and about 66% efficient for peaks, the input power to the finals would be about (1/33% X 130=) 390 watts on the dead key and about (1/66% X 520=) 780 watts on the peaks.

So the input power would double as the dead key power to peak power ratio quadrupled.

For ICAS (20% duty cycle) operation you can possibly double those numbers as long as you do not exceed any of the MAXIMUM current ratings for any of the tube elements.

That would bring the numbers up to 260 watts dead key and 1040 watts peak with the input power to the finals ranging from 780 watts at dead key to 1560 watts on peaks.

(This is assuming that the power supply is strong enough and the tubes maximum current ratings are not exceeded).

Another example: a pair of 3-500Z tubes with each tube rated at 500 watts of plate dissipation.

500 watts per tube / 2 = 250 watts dead key per tube X 2 tubes = 500 watts dead key

500 watts per tube X2=1000 watts peak power per tube X 2 tubes = 2000 watts peak power

The amplifier's power supply would have to provide an input power of about (1/33% X 500=) 1500 watts for the dead key and about (1/66% X 2000=) 3000 watts for the peaks.

For ICAS (20% duty cycle) operation, you can possibly double those numbers as long as you do not exceed any of the maximum current ratings of any of the tube elements.

Most etches. accomplish that by raising the plate voltage and then adding negative grid bias to bring the tubes quiescent current back somewhere close to cutoff, which allows you to increase the input power without increasing the plate current. (NOTE: Using this method raises the plate impedance of the amplifier so the output tank circuit should be changed to match the new plate impedance)

Disclaimer: This data is presented here as an educational example only and is not intended to be used for building linear amplifiers.

Regards,

#12

I purchased the fire-up 99 from firestik. After installation I noted an increase in receive and transmit. My gain in performance was only a half an S-Unit. This still is an improvement over the original setup. The wound top section of the fs99 makes the antenna "act" like a 5/8ths wave antenna. 5/8ths wave antennas have a lower radiation pattern. They keep more of the signal at the earths horizon than a regular 1/2 wave antenna,such as the antron99. If you want a better performing fiberglass base antenna, Check into the I-Max2000.

Jay,

I say, old boy, I missed Tea today! I much prefer Sun Drop, a local citrus soft drink! Most people have never heard of it--or Cheerwine, either. That's also a local soft drink.

Well, while I am quite patriotic and just as American as anyone, I still consider Britain one of our best allies in modern times. The WWII era is one of my favorite subjects. I "spoke" with Ray, the guy you were ragging (a little), via email and found out that his father died in '45 flying Spitfires and that he was severely wounded during Desert Storm, which put an end to his rather lengthy military career.

I am not British, but I am also sensitive to the fact that my ancestors came from England and Scotland. In a way, lots of us are "them" and "they" is us. They are likely the best friends we have in the world as allies go. Sure, we don't always agree, but we are allies and friends just the same.

The British navy is one of the things that I like to read about and see on Discover/TLC particularly during WWII. The sinking of the Bismarck and.....er uh, was it the Graf Spee? I think that was the other one. Very interesting chases...I may have the whole thing a little crossed up.

Lastly, I comment on the movie U571 which I haven't yet seen. This film portrays the US Navy capturing this sub and the "enigma" machine, and kinda promotes the "myth" that it was only the US who achieved great things in WWII. It was actually the BRITISH who captured the German enigma machine, and the decyphering of the messages took place in London. I saw where the British were quite indignant at this film be-cause it slants history and presents an inaccuracy. I can't say I blame them.

But, by the same token, I also enjoy seeing US forces fighting in the same war as a great part of OUR history. The great generals such as Patton, Bradley, Wainwright, and McArthur. My favorite British general (later Chief of the Imperial Staff) was Montgomery.

After all, we all are people no matter where we are from. It's a shame that wars happen at all. But they WILL.

I will.
>
> 73, Jeff KH6O

The history of the Q code stems from the Morse code era. The Q code is
in fact an international radiotelegraph code which was designed with
shipboard CW operation in mind. Hams took many, but not all, of the Q
signals as there own in the early days when most Hams were only using
CW.
Yep...Maybe there was no choice in the matter.

Ten - XX code is much newer. It was not only used by police in chase
movies but was designed for radiotelephone land mobile usage.
Many emergency services train operators to use ten-xx codes. Naturally
it found its way into CB lingo where it may be more applicable than Q
code.

QSL?

Now on the Internet there is no need for Q code or ten-xx code IMHO.
We can't send QRP e-mail unless we can use a weak provider. My typos

and misspelled words leave enough stuff for NG readers to decode, so why would I need any codes...except maybe to be considered an "in" Ham OM?

Uniden President HR 2600 w/Chipswitch installed. Recently aligned and gone over. Covers 24.800 to 29.999 AM/FM/SSB/CW with channel memories and programmable scanning, freq offsets and more. Comes with everything as it did when new including box and Chipswitch manual. Speaker output jack is now minijack, instead of that annoying nylon thing. $250.00 I accept PayPal or US Postal M/Os only. for an extra $50, I will throw in a Turner +2 desk mic and a older style (which was better) Cobra hand held power dynamic mic both pre-wired, to go along with the stock up/down mic. Shipping extra.

'lq6s do about 150 watts PEP or 450 for the trio. Should be about 110 on a dead key. 190 watts sounds about right for the reading on a Bird 43 when you holller Audiooooooo. Believe these had a red line on the meter. Peak out the controls for max out on a dead key then back off on the load knob till the meter is on the red line.

Whatever. I am still trying to figure out just why the efficiency of a Class B amp changes with input. I think you will find that just about every manufacturer of this classic design has recommended a 400 watt dead carrier INPUT limit for Antique Modulation, beginning with Heathkit probably longer ago than you are old based on exactly the math I used.

The 811 was a common, indeed classic, Class B modulator before anyone ever heard of linear amps, grounded grid or otherwise, and like any other Class B device has a theoretical max efficiency of 66.67% with operating efficiencies in the 60% range in practical use given that they are not designed by idiot rules of thumb.

The disclaimer may be the only part you got right.

> and wilson antenna, a swr of 1.6, is this a bad thing and how do I adjust
> it??
>
> --

Charles,
1. The SWR meter should be after the amplifier and before the
antenna.
2. The length of the jumper makes no difference, within reason. The
jumper should be long enough to reach between appliances with a
bit
left over. There is no specific length for jumpers, no matter
what
anyone tells you.
3. Yes, it does matter. If you have a good SWR before putting the
amplifier in-line, and have a bad SWR after the amplifier is
in-line,
it tells you that either you have changed antenna 'tunning', or
the
amplifier is 'dirty' or mis-constructed. Both conditions being
bad
news. Loss of performance and an RFI producer.
4. From your measurements, it sounds like you have an 'average' SWR
between the radio/amplifier and amplifier/antenna. This is not
very
'bad',(matter of fact, not bad at all!), and you do not adjust it.

You probably won't ever see it, but there should be a sign on most
solid-state amplifiers saying, "No user servicable parts inside". If
you
don't know what you're doing, and if you don't have the equipment to
do it
with... stay out of it.

I would be inclined to agree with the merits of a top-wound "stinger" lowering the angle of radiation and enhancing local and ground wave communications. Also 5/8ths should beat 1/4 wave anytime, if the math of the conversion works out that way. One way to find out for sure would be to take some field strength measurements before and after.

Just a thought...

Of course.....the First Floor in the US is the Ground Floor in the UK...this is why I couldn't see your problem at first.

Over here, drilling through the ceiling would in most cases get you from the attic to the First Floor.

I had the same solution to a similar problem of an antenna mounting on the chimney stack, I led the coax down the stack, through the roof and into the attic, along the attic joists, out through the attic air vents, down the exterior wall, and into the wall on the Ground Floor.

If you're running VHF make sure you get low loss coax.

hmm, great idea, because large sums of money don't interest me, fat girls snapping their thongs in front of me doesn't interest me, raising money in buddhist monasteries doesn't interest me, etc, etc. but what does is strict adherence to the constitution. so sorry, under me there would be no corporate welfare , and no welfare under any cicumstances. the answer is simple. freeze government spending, redo the tax system to a consumption tax scheme, and start downsizing government. ten year phase out of the disastrous lbj programs, repeal of a lot of executive orders, especially by this president. stop printing money all the time. consider going back on the gold standard or some reasonable facsimile thereof. restructuring of the fed, that would include a 5 year phase out of said institution or their quasi governmental association. ohhhhhhhhhhhhhhhh, there would be no joy in muddville on that one. also start controlling our borders severely. and i would give serious consideration to kicking out the united nations organization. let them move to europe. hell that is where they belong anyways. rebuild the military to new levels. find and arrest all known spys and anyone that has in the last several years sold any kind of info to the chinese or anyone else. expell all cuban prisoners who have been held in our prisons since the mariel boatlift catastrophe. take them to quantanamo and push them through the door pal. reactivate the cia and give it the powers to do bad things to our enemies. look out for number 1 , the usa always. geez, i am sure there is more but you can only squeeze in so much in 4 years, cd is out.....

I use an "N" type bulkhead for low loss.
It just looks better.
Cable guy who did cable modem install really had questions about
that large connector.
I had to inform him.
Also, my wall had no supporting horizontal 2x4's between the studs
so the fish was fairly easy.
Although, I had to drill through several stacked 2x4's at the top of the
wall.
I had the drill a smoking that day.

2023. Re: 10Khz slide or 5Khz jump

Newsgroup: rec.radio.cb
Date: 2000-10-17 01:47:23 UTC
From: MC 10kW Jesus <qsl27@hotmail.com>
Message-ID: <39EBB0C5.BDD8FD94@hotmail.com>
Source record: 55860

I once used an EPROM and allocated one of the input address pins to jump -up- 10kHz. Works perfectly, but admittedly not for young players and it sounds like you've already expanded the coverage so..... Years ago I modified a PLL02A rig using small variable capacitors (50pF if memory serves correctly) strapped over the Xtals in the clarifier and pulled to ground through the collector of an NPN transistor (2N2222 works here). A SPDT switch applies 12V to the base of each (via 47k resistor to limit current) to go up 10kHz (or was it down?!). When off, the line is pulled to ground to avoid any chance of oscillator sliding on its own.

Most N connectors are 50 Ohms and not the 75 Ohms that TV (and cable modems) call for. Some N connectors are indeed 75 Ohms, but not many! In Greg's case it is probably easiest to go down outside of the building and in the wall. It doesn't make for the neatest install, but the cable TV monkeys get away with it.

I disagree here...Lower side 16 was THE sideband channel...with 15 and 17 the back ups..Spent many many hours on LSB 16 in the mid 70's...of course many of us used the "upper" channels alot there...like way up to 27.405.. :) where the lower ones below one was for AMers...To me there aint nothing like side band..I will talk on AM only if I have to. All of the channels in the old 23 channel range have been claimed (at least in the area) by the AMers. So have SSB on a old 23 channel aint much good around here. However your mileage may vary from where you are at.

Tongue-in-cheek, Bob. I was questioning "enfield's" comment above
where he writes: "An archaic QRP rig?"

>By using low power transmitters you can simulate
>bad propagation conditions when there are good propagation conditions.

I suggest you read Adrian Weiss' book, "History of QRP in the U.S.,
1924-1960" to see what our predecessors were able to accomplish
with low power. In those early years, there was no choice in the
matter.

Easy way out is to make a small hole in the ceiling of the nearest closet and bring the coax down through there, out under the door and over to the rig.

Or, if you can get by with it, just make a small ceiling hold in the corner of the shack and bring the cable down there. Easily patched with a little spackling paste when no longer needed for the cable.

No. That is when you become a radio hacker.

A good technician understands what all the parts are for, and how to
adjust the circuits for peak performance.

An engineer knows how to design a new circuit that would be an improvement
over the one in the radio, which is usually a compromise due to efforts to
minimize cost by the manufacturer.

This is false. I had a 23 channel SSB radio back in the early 70's,
long before the band was expanded to 40 channels.

Actually, a lousy amp is not good for AM either. But so many AM stations do not care what their signal sounds like - as long as it is loud, that AMers have started to believe that a Class C amp is fine.

SSBers are generally more picky, and do not like overmodulation or drastically distorted signals.

I am not sure what you mean by "biased amp". Whether an amp needs bias or not has nothing to do with whether it is to be operated AM or SSB.

No really decent amplifier relies on rf sensing for relay keying. All such amplilifiers will have a dedicated keying circuit, so the amp is keyed whenever the mike is keyed (if the amp is in operating mode rather than off or in standby mode).

I'm looking for repair parts for some CB gear...

Raytheon CB radios and handhelds:
- complete radios, parts units, crystals, mics, owner's manuals, service manuals, literature, advertisements, catalogs, whatever!

Tram XL-5:
- 11.750 MHz crystal
- original hand mic

Johnson Messenger 323:
- speaker, schematic diagram, may be interested in a whole radio for parts (this is to fix one for my next door neighbor)

HyGain III:
- need the concentric volume/RFGain pot and knobs

Lafayette Comstat:
- need a top cabinet cover from a Comstat 25, 25a, or 23 (any marque); can also use a top cover from a Robyn T-123/a/b, Teaberry Model "T", and perhaps others
- Need schematic / service info for Comstat 25 (the original model, not the 25a or 25b); there is no Sams on this radio, so must have the Lafayette service manual and schematic for this one

73,
Dean, K5DH
Visit my Raytheon CB radio web site:

May, 1993 issue of 73 Amateur Radio Today has construction article for building a 12W max in and 200W out amp good with SSB-FM-CW. Good from 7 MHz thru 225 MHz with no tuning or bandswitching. Uses ONE dual MOSFET and fits on a set of circuit boards in a 2"L x 2"W x 1"H project box exclusive of COR and pre-amp.

F.A.R. Circuits had board set [as of 1995] for about eight dollars.

MOSFET cost 154.00 in 1995. Total cost of unit worked out to about 359.00. Interstage transformers are only bottleneck. Company which makes them and sells components for rolling your own would not sell less than five of each or material for making five of each. Cost of them, however was not prohibitively expensive and if you could find four others to build theirs, you'd come out for about 295.00

> Class B amp changes with input.

Because in a class 'B' amplifier the average current drawn from the power supply changes with the drive level.

Little or no drive = little or no (quiescent) plate current. (high plate impedance)

More drive = more plate current. (lower plate impedance)

Lots of drive = lots of plate current. (lowest plate impedance)

> I think you will find that just about every
> manufacturer of this classic design has recommended a 400 watt dead carrier

Please provide references for your information from 'almost every manufacturer'.

Some direct quotes from Hallicrafters, Collins, Hammurlund, Eico, Allied, Cenco, Heathkit, Barker&Williamson, Multi-phase, Johnson, etc..... documents would be nice.

I have a hunch that you may be misinterpreting what you are reading.

> The 811 was a common, indeed classic, Class B modulator before anyone ever
> heard of linear amps,

There is a huge difference between a modulator and a linear when you are talking about antique AM equipment!

There is a huge difference between high level plate modulation using a push-pull class B modulator to modulate a single ended class B or C RF amplifier stage in an old Heathkit transmitter, and the operation of a straight class B linear amplifier.

> grounded grid or otherwise, and like any other Class B
> device has a theoretical max efficiency of 66.67% with operating
> efficiencies in the 60% range in practical use

Since the output tuning network of a linear amplifier performs an impedance matching function, I would want it to be the most efficient at my highest power output, which would occur at my modulation peaks and where the plate impedance is the lowest.

Since the output impedance varies with drive level, the amp CANNOT POSSIBLY have the same efficiency at low drive levels that it has with high drive levels (unless the output tuning is changed to match to that variation in the output impedance).

You can do that with FM, CW, and kinda sorta with SSB, but not with AM.

Since we cannot change that tuning ratio at an audio rate to match our modulation peaks, we have to make a choice of what power level we tune to, and since we want a clean signal, we decide to have 'headroom' available and tune our amplifiers for maximum efficiency at the PEAK power level instead of at the dead key level.

If you make the mistake of tuning for maximum (66%) efficiency at the dead key level, you will be undercoupled to the load of the antenna on the modulation peaks, leading to serious levels of harmonic distortion and an average power level that appears to 'back-up' when viewed on any average reading power meter.

If you tune for maximum efficiency at the peak power level, you are making sure that the headroom you need will be there when you need it.

Unfortunately, when you tune for maximum efficiency at the peak power levels, you pay a penalty in efficiency at lower power levels, and that relationship is about 2 to 1.

So you end up with about a 33% efficiency on the dead key power level and optimum efficiency (66%) at your peak power levels which is where you need it the most.

> given that they are not
> designed by idiot rules of thumb.

Anyone here who has ever loaded a tube linear on AM knows that unless they back off on the dead key power by adjusting the antenna load control, they will not see full power out of their amp. when they start to modulate that carrier, and their audio will sound fuzzy and distorted.

They have learned either through trial and error, experimentation, or advice from more experienced CBrs, that by turning the load control such that the plates of the antenna loading capacitor unmesh (less capacitance) to drop the dead key carrier 20 to 30 percent, they get much more clean power out of their amp when they modulate.

They have been doing that for years but never really understood why they were doing it.

All they knew is that it worked.

They were simply tuning for higher efficiency at the peak power levels, and trading off some their dead key power level efficiency to do so!

So if those are IDIOT rules of thumb, there are a lot of us IDIOTS out there!

By the way, do you know the origin of the phrase 'RULE OF THUMB'?

You ought to if you are going to use it.

I'll give you a hint.

It had something to do with the diameter of a tree branch that you could legally beat someone with.

> The disclaimer may be the only part you got right.

You have the right to your opinion, as I have the right to mine, and everyone else on this Newsgroup has the right to theirs.

History will determine who was right and who was wrong, and I suspect that someday you may have a different viewpoint.

Hi,
I am interested in purchasing a Galaxy 959 DX radio, and installing the extra freq's "Viagra Board" into it. I am thinking about installing the board myself, it looks fairly straightforward to install. Trouble is, they say the rig needs a complete re-alignment after the install. I want to know if any of you have installed one of these, and gotten away with doing it without the re-alignment? How did it go, how well did the radio work etc? Come on, I know someone out there must have some sorta experience with this.
Inquiring minds need to know,
Jagzilla

Dennis,
I don't know who #12 is, but his 'rules will certainly
make the tube manufacturors happy!
Just a few other things; AM is a 100% duty mode; an
AL-811H may be able to do 1000+ watts if your talking about
input power but "never happen" for AM output power; ICAS
(20%) duty cycle has absolutely no application with this
situation; Raising plate voltage will certainly increase
output, but you also need to up-grade other components to
handle this voltage increase. Not sure it would be worth
it with an AL-811H.
I'd also recomend geting a large paper bag to catch the
smoke that will come out of the AL-811H when you get over
a 1000 watts output on AM from it...

Dennis,
I'm afraid your mistaken about 'opinions'. What the
thread is about is not opinion, but fact. I'm also afraid
that your 'facts' are just slightly 'skewed'.
If you want to tune ~your~ AL-811H using your 'opinions',
that's perfectly okay. But don't try that with ~my~ AL-811H,
unless your willing to replace the tubes...please, no Penta's!

Do the "regular" mod & skip the viagra board. The board has Xtals, & 6 "cans" that must be tuned, along with a few on the main board too. As the radio gets hot or cold, one or 2 bands might tend "drift"... The "regular mod" won't give a neat 40/40/40, but since the main existing PLL is doing all the work, they are dead on freq.....

2058. What is antenna Gain ?

How is it measerued ? Is their near-field gain, vs. say 20 miles ?
Tyring to compare the I-max(Newer Antron) and the Maco V58, they
are both suposed to be 5/8 wave antennas, that's the apples to
apples part.

Thanks alot

That's your opinion.

And so far I have produced more facts that you have.

> I'm also afraid
> that your 'facts' are just slightly 'skewed'.

That's only your opinion again.

And don't be afraid, I don't bite.

Unless you can produce 'FACTS' to the contrary, then you have only stated your opinion here.

> If you want to tune ~your~ AL-811H using your 'opinions',
> that's perfectly okay.

Thank you, but I wouldn't even consider owning an AL-811H

Those 811's are the worst harmonic generating tube ever created.

Followed closely be the higher power 572B's.

> But don't try that with ~my~ AL-811H,

I wouldn't think of it.

Matter of fact; I wouldn't even consider it!

I prefer Gates, Harris and older ETO-ALPHA equipment.

> unless your willing to replace the tubes...please, no Penta's!
> 'Doc

You should consider doing the plug-in upgrade on that AL-811H to convert it to 572B's.

Don't you ever unkey?

Did you ever read your manual for the AL-811H?

See if you can find either ICAS, or DUTY CYCLE, in the index.

Did you ever hear of a peak reading meter?

> Raising plate voltage will certainly increase
> output, but you also need to up-grade other components to

Thank you so much for explaining that to me.

And in such great detail too.

> Not sure it would be worth

> a 1000 watts output on AM from it...
> 'Doc

Especially with a 100% duty cycle. (Doc keeps his unit keyed down 7 X 24
because AM is a 100% duty cycle)

ICAS = Intermittent Commercial Amateur Service, it means that you occasionally
quit talking (unkey) and listen to what someone else has to say!

Have you ever tried that?

I had a 75 for a bit, I liked it. BUT you must remember as far as I could find it cannot be adjusted or modified. It is a nice simple cb and very easy to keep out of sight and you dont have to go drilling or mounting anywhere in the vehicle.

The speaker sucks, repeat sucks. You WILL have a hard time hearing out of that thing. You will want a external speaker, no doubt about it. You may as well average in the cost of the external otherwise you will get tired of yelling 10-9

You will just about always see an increase in the SWR reading when you go to a higher power using a run of the mill watt meter. They dont read SWR accurately at low power, always indicating it is better than reality. It is not unusual to find that your 1.3:1 SWR at 4 watts is really 2:1 when you give it a little power. You can have the same problem with a good meter if you use the wrong slugs. If you are using a hundred watt slug to read forward power you should use a ten watt slug to read reverse to get an accurate SWR reading. Of course you should check reverse power using the big slug first to make sure the SWR is low enough that you dont burn out the small slug.

> this upgrade?

More available plate dissipation, and higher maximum plate and grid current ratings.

There is more than one way to get more power out of an amp.

One way is to increase plate voltage, the other is to increase plate current, the best way is to do both.

The 572B's can handle more drive, which equates to more plate current, which equates to more power input.

The output matching network, (tune and load caps plus tapped inductor) will have to be readjusted for the lower output impedance.

This can usually be done by increasing the plate tune capacitance value and retuning the load capacitance for the highest peak power out.

This is an interactive tuning operation, so you may have to re-adjust the tune and load caps a few times before you reach the optimum tuning.

To really take advantage of the lowered plate impedance, you should really lower the inductance value by moving the tap on the coil.

But since most are using the 10 meter position for 11 meter operation anyway, the inductance value was always too low to begin with.

But even if you don't change anything, the increased plate dissipation capability will make the amp more 'forgiving' of tuning and loading errors, and/or high output SWR problems.

You may even be able to run as a broadcast station, you know, that 100% AM duty cycle that Doc talked about, but I don't think the power transformer would hold up to that, because it is usually ICAS rated!

An antenna doesn't have gain because it is a passive (non-powered) device.
Any apparent gain is due to the radiation lobes being aimed at the horizon
or a beam antenna is being used that concentrates the energy in one direction.

I personally believe the V58 is superior to any fiberglass base antenna.
If you want a really good 5/8 wave, talk to Jay in the Mojave.

My Dad has one and it is a basic CB. He has a good antenna so that helps.
The speaker does suck so count on an external speaker. His is mounted in
the compartment between the front seats. He can put it in there and close
the cover and it is out of sight.
You have to climb up on the mic, it doe not seem to be very sensitive. It's
got weather on it which is nice. They are fairly inexpensive up here in
Canada ($99.00 cdn).

Source record: 55985

Hello G Young: The Moonraker 4 element beam antenna is pretty well designed as is. There have been people that say the Moonraker 4 or 6 element beam antenna can be modified bt adding additional reflectors to the reflector loop. This is plain wrong.

I have modeled the Moonraker 4 on Eznec, (a antenna program that allows you to dial in your antenna design, and see what the antennas energy pattern will look like) and I have tried many different design changes to the reflector loop, and all the additional loops made the beam antenna act like a omni directional antenna. Degrading the antenna big time.

There are no free lunches in antenna design. Meaning if you want more gain, you need a bigger antenna. I have talked with the antenna design engineers at Avanti and then Antennas Specialist when they where in the CB antenna business. Everyone I talked to said to assembly the antenna per the assembly instructions and get the antennas as high as you can. The engineers would love to add some simple part, loop, or gadget to increase the antennas performance, in a heart beat.

I will be putting up a Moonraker 4 in a few weeks, and I won't be trying anything different.

> INPUT.

Rick,

I went to that web page and read the specs.

The figures shown only back up what I presented in the earlier post.

1000 Watts seems to be the maximum input power no matter what the mode (I wonder if that had anything to do with the 1000W input power limit the ham operators had back when that amp was new?), so I will use that as the maximum input power that would be available for an AM carrier peak.

1000 Watts X 66% = 660 watts of peak power output available on AM.

The dead key power should be about 1/4 of that, or 660/4 = 165 watts Dead Key.

Assuming only a 33% efficiency on the dead key, the input power at that time would have to be (1/33%)X165 watts

or 3 X 165 watts = 495 watts

Heath specified the AM input to be 400 Watts unless controlled carrier modulation was used, which allowed the input to be as high as 500 watts.

So my numbers were definitely IN THE BALLPARK.

Variations in amplifier efficiency can account for the differences in the numbers, but I believe that Heathkit was 'hedging' on it's published numbers for that amp with the full knowledge that amateurs would be running it at higher than the legal input power levels specified in the ad.

Regards and have a good weekend, mine is starting as soon as I finish these posts to the newsgroup.

"Dennis W. Ostrowski",
It seems you have a problem when your told about mistakes you've made. Go ahead and have your fun, you'll need something to remember when you're stuffing all that smoke back into the amplifier.
If you intend to help someone with your advice, that's great. But when you tell people something to harm their equipment, that's something else. You ought to be ashamed of your self. I would guess that "#12" refers to your mental age.
Theoretical knowledge is nice to have, but your practical knowledge of Ameritron amplifiers is lacking...
'Doc
PS - That's really not 'Fractenna' or Chip, is it?

Jimbo,
Antenna testing ranges will perform any test that you require on a supplied antenna. Some are physical, others are computer generated measurements. Try one of these;

<www.antennaassociates.com>
<www.seavyantenna.com>

I'm sure that they would be happy to tell you what they do for an average test.
The fees for using an antenna range are completely out of reason for most CB/ham/casual manufacturors. If you ask prices, sit down first!

"Dennis W. Ostrowski" <dwostrowski@lucent.com> wrote in message news:39EE3497.6D9137F@lucent.com...

OK, let us see if I have this straight:

A linear amplifier's efficiency varies with input because the output is mismatched at every level other than the one it is set for. Makes sense.

This is not a problem with plate modulated Class C transmitters, the broadcast type with which I am most familiar, because both plate voltage and current change proportionately and plate resistance is therefore constant under modulation. OK, now I don't feel quite so bad missing this. Might be an interesting problem with bi-polar transistors however but that is for another day.

It is generally not a huge problem with SSB because one tunes to highest output almost by default. All that happens is a bit of volume expansion.

So this effect occurs only with Antique Modulation thru a linear, which pretty well restricts it to the vicinity of 27 MHz these days.

So the key issue is the effect of the mismatch on heat. Assume for the moment that we are tuned to the Max PEP or four times carrier. Now PEP doesn't measure heat, RMS does and at that moment, we are running 600 RMS in, presumably somewhere near 60% efficient, so 240 of it goes to heat. This is pretty close to the 260 watts of plate dissipation available on 811A,s but we are not going to be running, one hopes, single tone modulation for an hour and a half.

On dead carrier, at 400 the efficiency could drop to 40% and still be within limits and given the 1.5:1 mismatch probably would. Still no worse than before.

So given that the operator did his final tuning with a single-tone at 100% there would not be any problem with heat that does not exist at 600 in. Unless the operator is a total nincompoop, he will have 'snuck up' on the tuning thru lower powers and should not have to diddle much with the single tone signal to get it right.

So it would seem that #12s Rule of Thumb (and there are other stories of the origin of that term BTW) would apply only if the plan is to tune up on dead carrier. One would get 160 watts of heat that way but 360 at 100% modulation. With normal voice modulation (35% avg to peak ratio) the average would be 230 watts which is close to what we did before. Now if the voice level is really compressed and we get a 60% average cycle, heat would indeed rise to 280 watts. Lots of things collapse with that much audio processing and scope tuning (trapezoid is my preference) would be a damn

good idea anyway.

There is, of course, another possibility. When they say 400 watts input on Ancient Mary, they may well mean single tone which I admit was not my interpretation. This would limit dead carrier input to about 275 and heating problems go away. It would also mean that the idea of driving it with a Johnson Viking Ranger becomes more absurd by the hour.

I think the long and short is that the inefficiencies of tuning an Archaic Modulation linear are real but not of huge import so long as we limit the discussion to heat.

Where you may well be right is audio quality. Certainly, tuning to peak is sensible here because the alternative is to flatten peaks, so-called flat-topping, and that doesn't do a whole lot for quality. So haven't we come down to one really major recommendation: Tune the damn thing with a single tone audio input??? Preferably with a scope?? Preferably into a good dummy load?

Enjoy the weekend, this is my Saturday to work my butt off. If it were only the gut.

Dick

2096. Power Supply Question

Newsgroup: rec.radio.cb
Date: 2000-10-18 00:00:00 UTC
From: Maveric <maveric169@hotmail.com>
Message-ID: <8sln4blvu1@slb3.atl.mindspring.net>
Source record: 56003

Does anyone have an extra AC to DC power supply that they might want to sell. I am using a PC Power supply but it is not doing the job. Or maybe someone can answer this question for me (I think I skipped this day of electronics class). On the PC power supply, it has lots of connections for equipment, all of the yellow wires are +12V. If I connect all of the +12V together lets say 4 of them, will I still have only a +12V output with more capacitance or will that give 48V? The problem that I am having is that if I get into a conversation my signal is fine for the first few minuets, but then it is like there is a power loss in my transmission, like the capacitors get drained and the power supply can't recharge them fast enough to provide the power required for my next transmission.

Any help will be greatly appreciated,

Maveric

I have a I-MAX 2000. After seeing the add for a firestik for the a99 on the Firestick web site. I replaced my 1/4 wave top section of my I-MAX with my 5' FirestickII. I read the 1/4 wave top section was resonate above 27 Mhz. So I removed the screw of the firestick. To my shocked surprise, I noticed I had increased bandwidth, equaling lower swr, better power dissipation (higher and more even output across the band), better local and skip transmit and receive. I hear more stations now than I ever have before. I didn't have to change anything else to my I-MAX and yes the threads are the same. They have done this upgrade themselves, that's where I got the idea. Try it - you'll like it. I didn't believe the add I saw, that's why I tried it. The freaky think is, that it did work [REALLY WELL]!

Rag Chew,
It ought to work. I'd do the grounding as close to the
antenna mount as I could, though.

From: Roger Harris <hwroger@interkan.net>
Message-ID: <8sl4k0$6ko$1@news.chatlink.com>
Source record: 56007

I am in need of some help on a Voyager radio Model 66-CW.
What I need is the modification to get the other channels. This is a 10meter radio that is suppose to be able to get the CB bands as well. If anyone has this info and can send it to me Please reply back to me at hwroger@interkan.net.
Thanks In Advance
Roger Harris

2101. Help with SWR on 5 pill install

Newsgroup: rec.radio.cb
Date: 2000-10-18 00:15:59 UTC
From: Charles Kingsland <audiowizard@mediaone.net>
Message-ID: <3Z5H5.27480$gw.2880045@typhoon.we.rr.com>
Source record: 55923

Ive just installed a 5 pill and have a few questions about the swr readings Im recieving and how to properly measure them.

Prior to the amp my swr was about 1.2 using my external swr meter with a 2 ft jumper.

Should I be measuring before the 5 pill, after the 5 pill???

Does any of this matter as long as the swr was good prior to the 5 pill being put in line, or am I suffering performance as I dont know exactly where and what to measure swr? What about the two foot jumper, when this is removed wouldnt the swr change, is this to small to worry about?

Ive got a 5000 roof mounted with a galaxy 77 and 5 pill. I used the standard wilson 5000 coax and a 6 ft jumper. I have measured SWR between the radio and 5 pill for a reading of 1.9?? On the other end between 5 pill and wilson antenna, a swr of 1.6, is this a bad thing and how do I adjust it??

--

2102. Re: Help with SWR on 5 pill install

Newsgroup: rec.radio.cb
Date: 2000-10-18 00:50:15 UTC
From: Charles Kingsland <audiowizard@mediaone.net>
Message-ID: <bt6H5.27488$gw.2896006@typhoon.we.rr.com>
Source record: 55924

This amp was constructed by an individual, I feel the unit is is a high quality piece and everyone I have spoke to holds the builder in high respect. I feel it would be in everyones best interest if I didnt mention his name. Anyway, I would never open this thing up unless exactly instructed to and how. It seemed as though the swr readings after the unit were a little high and I need others input. I just want this puppy to work as well as it can, Ive already got enough invested, I dont want any waste.

Thanks for your input

Key it up with 4 watts in and quickly adjust the tune for max power out with the load set for about midway. Then adjust the load for max out. There will be some interaction betwenn the controls so will have to go back and forth a couple of times. Did not have the book on the Boomer but the 3+3 is very similar and uses the same tubes. They do not mention a "red line" but just says to tune for max output and says to limit drive to 5 watts. If someone says you sound like you have a mouth full of marbles cut back on the load a little and readjust tune for max. Keep doing this until the audio sounds good.

I have my doubts about how much better a top loaded antenna is than bottom or center loaded antennas when it comes to CB. Usually a top loaded antenna has a capacity hat that greatly reduces the amount of wire/inductance that is reqired to top load a shortened antenna. This is missing from most CB antennas. All the theory and articles I have seen that extols the virtues of top loaded antennas was in reference to antennas that used capacity hats along with the coils.

Source record: 55929

A man left for work one Friday afternoon. But, being payday, instead of going home, he stayed out the entire weekend partying with the boys and spending his entire paycheck.
When He finally appeared at home, Sunday Night, he was confronted by a very angry wife and was barraged for nearly two hours with a tirade befitting his actions.
Finally his wife stopped the nagging and simply said to him. "How would you like it if you didn't see me for two or three days?"
To which he replied. "That would be fine with me."
Monday went by and he didn't see his wife. Tuesday and Wednesday came and went with the same results. Come Thursday, the swelling went down just enough where he could see her a little out of the corner of his left eye.

I have to agree ..... its notr as good as they say but I've sold several of them and all my customers say it increases thier rcve signal at least 1/2 S unit. so I say if you break the top section of your antron 99 then the best thing to do is to replace it with a fire-up 99 by Fire stick.....seems to be an improvement....

I'll add to what hammforfun says....when you back off on the LOAD you should do it clockwise... if you will notice there is a fast rise side and a slow rise side to the peak of the load....always back off on the slow rise side..... about 10% or less... that will give you good forward swing..... you should be able to bleed at least 200 channels any direction... sad but true....

I think doc hit the nail on the head..... his advice is solid and
good..... the only thing I can add is that if your swr rises with
power then your ground ain't worth a flip..... what works at 4 watts
may not work at 200.... start checking grounds..... if you run
much power then minor things have to be purfect.....

Ive got about 2ft of 4 guage to the frame for 12vdc ground. I dont see a problem there, the antenna was installed in the roof a wilson 5000 should I look into how well the antenna is grounding there or is that roof mount pretty much a given done deal, Im not sure how I could improve on the antenna as when bolted down it really bites into the sheet metal.

Is this number a radio manufacturers specific number rather than the
actual transistor number. It might be better to explain what section
of what radio this transistor is out of.

You probably haven't been around here very long or you'd know all to well, the taste of leather that one gets when their foot has been firmly planted in one's mouth.

Dennis has been around long enough to have had many discussions such as this, and he has proven many times that he knows amplifiers (and many other things). I would be careful about challenging his points unless you have something concrete to back it up. Also, resorting to personal insults only weakens your position. Disagreeing with someone's point is one thing, but there's no need to add slurs to the mix.

I recommend leaving your coax intact, and using a short
length of copper wire to the inside the trunk ground.
Coax does not like water, and breaking the outer covering
is not recommended. If you do not have any copper wire
handy, Home Depot sells bare 6 Gage copper by the foot.

HAMFEST October 29, 2000 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - October 29, 2000

LINDENHURST, LI - NY

On October 29, 2000 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and access-ories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Walter Wenzel KA2RGI at 631 957-0218 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. Wife's and children under 12 admitted with no charge.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam session. Current ARRL/VEC fee is $ 6.65,
exact change is appreciated.

Talk-in will be via GSBARC Repeater on 146.685 -600 136.5 PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 136.5 PL required. You may also write to:

Great South Bay ARC
P.O. Box 1356
West Babylon, NY 11704

E-mail GSBARC info@gsbarc.org or visit GSBARC online at

Antenna Associates maintains two outdoor range facilities available to electrically test your microwave and RF antennas. These facilities are available for long and short terms at competitive fixed rate fees. Fees include Antenna Associates' highly qualified personnel to perform your testing requirements.

Scientific Atlanta Equipment is used to insure measurement accuracy. Our standard test range setup accomodates frequency ranges from 600 MHz up to 18 GHz. Other frequencies available upon request.

Antenna Assocociates also maintains a 1400 foot test range capable of measuring and recording the same parameters as the 110 foot test range. The only difference between the two test ranges other than their length is the weight of the antennas they can accomodate. The 110 foot test range can accomodate antennas up to 250lbs. while the 1400 foot test range can accomodate antennas up to 1000 lbs.

Partial Equipment List
Scientific Atlanta 58730 Model Tower
Scientific Atlanta 1580 Recorder
Scientific Atlanta 53300 Positioner
Scientific Atlanta 1741 Receiver
Scientific Atlanta 1810 Digital Frequency Display

Antenna Associates offers accurate and reliable testing, complete confidentiality, at competitive rates. After your testing is complete you will be provided with an accurate, independent evaluation of your antenna's performance.

ANTENNA TEST RANGE

RSI Technical Products' antenna test range is one of the finest and most versatile in the United States. This state-of-the-art facility provides outstanding resources for testing today's precision antennas. Both production and specialized projects are easily accommodated, with built-in flexibility for research and development needs. Located near Dulles Airport in the Washington, DC metropolitan area, the test range encompasses 116 acres and is comprised of 10 test sites. The test range is minutes from RSI Technical Products' manufacturing facilities.

The test range is supported by a trained staff of test technicians, RF and mechanical engineers. The fabrication, welding and machine shop at RSI Technical Products' main facility provides support for all projects at the test range.

Features

Equipped to test antennas operating from 30 kHz to 60.0 GHz, including the MILSTAR frequency bands

Available for a wide range of testing, from small millimeter wave feeds, to antennas up to 60 feet in diameter

Unique ranges can be configured for specific testing requirements. Available Fresnel fences are positioned to provide specific quiet zone characteristics

Measurement capabilities include all standard antenna characteristics, i.e., radiation patterns, gain, axial ratio, return loss, insertion loss, and noise temperature

A wide range of source antennas are permanently mounted for use in both elevated and ground reflection ranges

Source antennas can be remotely peaked on boresights

Source antenna polarization can be changed through remotely controlled signal generator

Specific ranges are computerized and equipped with uplink/downlink satellite communications

Ranges are interconnected via underground fiber optic cables and phone lines

Test sites are certified by the FAA, DoD agencies, and prime contractors, as well as licensed by the FCC

Test sites are conveniently arranged around a centrally located antenna integration facility (see the attached diagram)

Antenna integration facility serves as the test control point for four test sites

Two anechoic chambers are available on site with a third located at the main plant

State-of-the-art test equipment includes signal generators, frequency counters, vector and scalar network analyzers, sweep generators, power amplifiers, oscilloscopes, power meters, spectrum analyzers and a time domain reflectometer

Capability to acquire antenna data digitally

Message-ID: <39EF01F1.572F9DCB@netscape.net>
Source record: 56043

Jimbo,

To quote my website:

Antenna gain is used to indicate the increase in power of one antenna (when transmitting or receiving) as compared to ANOTHER antenna. Gain is actually a ratio of power levels and is stated in decibels, often abbreviated "db". So how do we use this number? Keep in mind I said "used to indicate the increase in power of one antenna as compared to another antenna.". So, how much gain does your antenna have compared to say, an actual coat hanger? Probably a lot! We know that a coat hanger could not be much of an antenna. But when using db gain to rate an antenna you must know what the reference antenna is!

It is important to note that antennas are passive, they do not "amplify" signals (or effect transmitted audio levels!), they merely re-distribute the power that they get to achieve gain. They have no effect on the "modulation" or audio quality of your radio! There are a few antenna manufactures that claim things like their beams, "have the best modulation". This is plain silly, over imaginative advertising.

End quote.

Two antennas usually used for the comparison are the dipole antenna and the isotropic "antenna" (an antenna that theoretically transmits equally in every direction). Gain should be stated with a reference antenna, like dBd (gain over dipole) or dBi (gain over isotropic).

Illustrations and full text of antenna basics:

From: Gordy Gale <gordygale@home.com>
Message-ID: <39EED96E.9E116371@home.com>
Source record: 56046

Uniden President HR 2600 w/Chipswitch installed. Recently aligned and gone over. Covers 24.800 to 29.999 AM/FM/SSB/CW with channel memories and programmable scanning, freq offsets and more. Comes with everything as it did when new including box and Chipswitch manual. Speaker output jack is now minijack, instead of that annoying nylon thing. $250.00 I accept PayPal or US Postal M/Os only. for an extra $50, I will throw in a Turner +2 desk mic and an older style (which was better) Cobra hand held power dynamic mic pre-wired, to go along with the stock up/down mic. Shipping extra.

2136. SuperStar 3900 Noise Blanker?

Newsgroup: rec.radio.cb
Date: 2000-10-19 00:00:00 UTC
From: Paul Knight <paul.knight@prairiecomm.com>
Message-ID: <8sn1gm$1ob0$1@news.enteract.com>
Source record: 56047

Hello! Is the noise blanker in the SuperStar 3900 at all effective against ignition noise? They're going for $129 now. I'm looking for a radio which has a killer noise blanker that can play in the 28.3-28.5 MHz 10M ham band.

I found that the noise blanker in the Radio Shack HTX-10 did almost nothing for my situation. Ditto the HR-2510/2600.

Thanks!

Paul WD8DKY

Greetings!

Perhaps the easiest way to offer any advice is for you to grab a book...

The one I recommened is "The Truth About CB Antennas" Orr and Cowan Published the the Radio Amateur Callbook.

The reason why is this...

Sure the more metal you have up in the air could help your receive, but when it comes to "Testing" any antenna, a series of measurements need to be made.

Since "Watts" going into the air can be somewhat hard to really, truly, and accurately - detect. Much of what one antenna maker says about "Their" antenna being better than the "Competition" is open for suggestion.

Watts/Volts/Meter or dB/dBi? What does this mean? Use of Field Strength meters. But at what height? Or Distance? Will you get those same results? Maybe, maybe not...

If you want to get an idea of what really happens when you use one antenna versus another, read about it. I highly recommend this book, as others may say the same. It clears up a lot, but then makes you ask questions too.

Hopefully the right ones.

To answer the question, each installation is slighly different from anyone elses. Ground effects, Height, Objects in Near-Field can attenuate even refract antenna radiation patterns...e&c...It's a guessing game and each antenna maker tries to develop the best "overall" antenna - but it depends a lot on how you put it all together. Each antenna tries to out-do the other - each has a plus and minus catagory - you have to make the choice.

Get the book, and read about what you are asking - these two antennas may offer what you need. Which one applies to you depends on how you apply the information.

Yes, 5/8's antennas are the best for the use of radiation pattern that will make it over a good variety of terrain - but you might as well be trying to talk on a dummy load if you don't accomodate for the antennas own needs.

If you do the install right, both will give the other a run for the money. It's a close call - user preference.

On Wed, 18 Oct 2000 10:53:07 -0700, while the modem was pondering it's navel, jimbo <st@yahoo.com> dissertated the following:

>How is it measerued ? Is their near-field gain, vs. say 20 miles ?

Newsgroup: rec.radio.cb
Date: 2000-10-19 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <39ef09e7.5021501@news.iserv.net>
Source record: 56049

Greetings!

Not a good idea...

The Biggest worry?

Water entry - and with salt - kiss that coax good-bye!

Copper corrodes due to the natural acidity of rainwater and with snow on the way - I wouldn't "Peel back the braid" if you can avoid it. Even moisture can ruin the dielectric of the coax and alter it's imepdance and then you'd have to pay some $$$ to fix the amp.

I have a better idea that can help by providing a sacificial anode to provide that ground better than peeling back a braid to try and ground the antenna.

Use the mount, but you'll need to take off the mount and apply a copper based grease [it has actual copper fillings in it] thats conductive, and the use of copper foil for "strapping" the trunk lid to the vehicle is even better - using both is the best.

Use the pinching means the mount uses, to firmly make the electrical connection to the trunk lid, and the strap - sandwiched via those set-screws - biting into the metal - to the foil under the trunk lip and use screws to fasten [bolts are preferred] to the vehicle body. Then seal all connections with some type of waterproof sealer [Goop works for me] and copper grease for the threads. Just don't go overboard, a little goes a looong way.

Greetings!

Aside from not drilling any holes, you may be stuck with a dummy load of an antenna.

If mounting the CB to any metal part of the passenger compartment is out of the question, there is little help we can provide you...

Care to take a gander and try to see if there is any copper or aluminum straps underneath all that overhead trim? I'm sure you'll find some and it may work to your advantage to use a permanent mount using the foil straps they have for static protection and shielding for EMI/RFI for the body of that MPV. These straps are soley for that purpose and can provide for your needs if you can locate them.

Greetings!

Just use one with a minimum surge rating of 500mA and at least 100PIV
due to the RF voltage floating around in there. Silicon [junction
semiconductor material] is recommended.

From: CodysPC@Iserve.Net
Message-ID: <39ef0edf.6292846@news.iserv.net>
Source record: 56056

Greetings!

Not without modification of the NB and ANL diodes from the Germanium 1N60 to Schottky types. ECG583 [Panthero] does work - I've done this on a Uniden PC-122 and it does work. [D1 and D2 by TP1] The threshold of where these things "trigger" and how they fire on impulse is a bit quicker - but under heavy adjacient channel interference, they tend to want to add more fuzz than get rid of impulse noises.

At this point, there is no "CB only" radio out on the market that has good performance in the ANL/NB section to what you're looking for. You would have to do the mod yourself.

Even the SS3900 has a few areas that fuel pump noise or bearing/wind noise can get into the receive. It's all part of the 10.7 IF filtering section...steady hiss gets by even the most stringent ANL sections.

I'm not saying anything is wrong with the SS3900, far from it.

But the ones I've owned - I've sold off because it picked up mobile noises other radios like Uniden and Cobra got rid of.

Hello- I have a CDE model CD44 antenna rotator for sale. This is very similar to the Telex/ Hy-Gain CD45II model that is sold today. This unit is is very good working condition, and will turn an 8.5 sq. ft. windload with little or no difficulty (when properly installed, inside a tower, with a thrust bearing.) Also with this unit, I am providing the buyer with 2) WORKING control boxes, an Accessory shelf, and 20 feet of 8-conductor rotor cable (for test-lead).. I am asking $175.00 buyer pays shipping. If you are intrested, please Email me maniac9188@aol.com Thanks for reading..... Charles

Agreed. A professional peak and tune usually includes better finals,
channel guard installation, and an oscilloscope session; that isn't a stock
piece of equipment anymore.

Maybe what he meant to say was professional? If the manufacturer won't
warranty the "professional peak and tune", it ain't professional<grin>.

2156. They almost came to blows!

Newsgroup: rec.radio.cb
Date: 2000-10-19 00:00:00 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <39EF2E65.38CC@bellsouth.net>
Source record: 56067

I was helping a friend re-hang his 75 meter antenna yesterday. Seems a neighbor has been having interference problems, came onto his property and cut the halyard. This is the second one that the guy has cut down. So my friend was pretty hot about the whole thing. He saw the guy out in his yard and hollered at him from the roof of his shop telling him that if he cut down any more antennas, he'd come over there and "whup" his you-know-what. Of course, that started an argument, threats, cussin', and the whole smear. The neighbor picked up a stick and came down to the property line. Neighbor's wife got the situation cooled down.

Here's the thing: The interference thing has been going on for some time. "Johnny" (not his real name) has tried to reason with them and tried to tell them how to cure the problem. He is a radio repairman since the late '50s and has an electronics shop. They absolutely refuse to listen. He has told them to contact the phone company and they would filter the line. He has tried to help them cure the TVI. Johnny and I went up there one day last year to offer to filter the TV. The guy ran me off the property and stood there shouting and cursing John. His whole thing is that he thinks he can force Johnny to shut down his ham station, which is 100% legal, and he will not hear to anything else. John could get the whole thing cleared up IF they would just listen. But when they are told that the problem lies in their own TV, phone, and stereo equipment, they just get mad. So what's a fellow to do? He's tried everything to be helpful. And the worst of it is that when they didn't even have a phone, it was Johnny who let them use his. When "Paul" (not his real name, either) needed to borrow money, he came to John who lent him $20. Johnny has tried to be a good neighbor, and now this piece of trash wants to play "I'll-show-that-ham-guy-who's-boss-around-here."

So, yesterday, it almost got to the fight stage. I kept quiet. But if it had come to blows, I'd have had to become involved to the extent of breaking it up by restraining the aggressor. I'm glad the man's wife had enough influence to prevent a fight.

This is just an example of how far such things can go between neighbors. Johnny has grounds for trespassing, malicious damage. The guy has the gall to come onto someone else's property and cut down antenna halyards. How do you deal with someone like that?

Jerry

Around here, a yardful of pit bulls keeps 'em away!

Actually, a small yappy dog will make enough noise to scare a cat.
Or maybe a motion sensor light attached to a solenoid on a garden hose?

For those of you with access to Happy Flyers, their DF unit is guaranteed to produce null capture with ONE DEGREE accuracy.

I built two units in 1979 to locate some idiots harassing one of our cycle group wives who worked swing shift at ER of local hospital. Would call from hospital prior to leaving and again in parking lot on group CB channel while pulling out.

Units use an EXAR 2211 FSK demod chip which gave directional outputs [red LED for left and green LED for right antenna turning to find null angle] and current to drive up to a 250-0-250 microammeter for 25-0-25 degree deviation from null bearing. I used 50-0-50 for 5-0-5 degree readings.

The husband used van with table and map of area on it with plastic overlay. Relative bearing cursors with string for finding cross points. Two of us on cycles with pole holding dipole antenna array. Cable to cycle CB and audio output to DF unit. I used hi-power Motorola PIN diodes in antenna switching circuit so we could transmit through array without having to disconnect array antenna and switch to cycle antenna.

Chuck and I went out on our Honda Gold Wing machines about one mile apart and waited for these idiots to transmit to third man's wife. We took our readings and moved in 1/2 mile each and took another set of bearings and reported to husband in van. First bearing set gave us a four-block square. Second set of bearings narrowed it down to one block. Before we could set up to df the house somebody came up on the channel and asked if anyone wanted to help him locate the fools who were giving the lady a hard time.

Chuck transmitted on the channel saying we had already narrowed the search area down to one block and were waiting for them to transmit again so we could get the house the signal was coming from.

Needless to say, they didn't transmit, and Linda was never bothered by them again.

In a test by Civil Air Patrol a Cessna 182 equipped with unit tuned to 121.5 MHz ELT frequency took off from Redding, California and headed toward "crash site" on Ashland Mountain across the Oregon border. The pilot was wearing a set of blue goggles and windshield had yellow mylar smoothed out on it to simulate IFR conditions with pilot flying on instruments and referring to 100-0-100 microammeter to maintain flight on null path.

CAP Major in right seat oversaw the flight and noticed as they flew over the "crash site" that a van festooned with antennas was about 100 feet to right of only set of trees in vicinity they flew over at about 1,000 feet. Upon landing at Ashland Airport the Major criticised the poor accuracy of the DF unit. The driver of the van, noting that if a pilot was crashing, he would invariably head for the major obstruction in the area and said he had put the ELT in the highest of the group of trees the Cessna flew over.

The crossover point for this device is about two feet in diameter, five thousand feet above any transmitter being sought!!

The circuit board has attenuator section for adding on auto-attenuation of up to 60 dB for use with FM receivers which have their audio saturated thus otherwise precluding the obtaining of bearing information. The attenuator circuit brings output of radio out of saturation allowing the FSK chip to present the bearing information necessary to locate the precise null path of the signal.

The two units I built up in '79 cost about 21.00 total with all purchased material and the additional 20.00 for two board sets and Construction and Operating Manual.

For further information, contact Hart Postlethwaite [hartpost@aol.com] and he can forward your inquiries to whomever has the board and manual kits now.

For those of you with knowledge of Happy Flyers, their DF unit is guaranteed to produce null capture with ONE DEGREE accuracy.

I built two units in 1979 to locate some idiots harassing one of our cycle group wives who worked swing shift at ER of local hospital. Linda would phone her husband from hospital prior to leaving and again in parking lot and on the way home on group CB channel. They'd foul-mouth her on the ten minute trip to her house.

Units use an EXAR 2211 FSK demod chip which gave directional outputs [red LED for left and green LED for right antenna turning to find null angle] and current to drive up to a 250-0-250 microammeter for 25-0-25 degree deviation from null bearing. I used 50-0-50 for 5-0-5 degree readings.

The husband used custom camping van with table and map of area on it with plastic overlay. Relative bearing cursors with string for finding cross points. Two of us on cycles with pole holding dipole antenna array. Cable to cycle CB and audio output to DF unit. I used hi-power Motorola PIN diodes in antenna switching circuit so we could transmit through array without having to disconnect array antenna and switch to cycle antenna. We'd use different channel to report bearings to avoid running them off the channel before we'd found them.

Chuck and I went out on our Honda Gold Wing machines about one mile apart and waited for these idiots to transmit to Linda. We took our readings and moved in 1/2 mile each and took another set of bearings and reported to husband in van. First bearing set gave us a four-block square. Second set of bearings narrowed it down to part of one block. Before we could set up to df the house somebody came up on the channel and asked if anyone wanted to help him locate the fools who were giving the lady a hard time.

Chuck forgot and transmitted on the channel saying we had already narrowed the search area down to one block and were waiting for them to transmit again so we could get the house the signal was coming from.

Needless to say, they didn't transmit, and Linda was never bothered by them again.

In a test by Civil Air Patrol a Cessna 182 equipped with unit tuned to 121.5 MHz ELT frequency took off from Redding, California and headed toward "crash site" on Ashland Mountain across the Oregon border. The neighbor came into your friend's yard AND damaged his property, despite all attempts at harmony? I forget what state you are in Jerry, but I'd check my state laws. Possibly file a harassment, vandalism, and/or trespassing complaint so at least it is on record, so the next time it happens, the law is clear on why the guy is full of buckshot. Here in the 'pile, it is permissible to use deadly force when protecting your family or personal property on your land, but one does not wish it to come to this over radio. I like the dog suggestion. I have a Shepherd that came from Bonn, and a fenced yard. Critters from the swamp occasionally come in, but they never leave.

Got an old Tempo 6-channel "rock" rig but would have to detune to 2-watt from original 10W. It's on packet now and working well so guess will have to look elsewhere but it's a thought.

Maybe pick up one of the ancient Icom IC-2xx rock rigs which used sub-C ni-cads/alkalines or car power with telescoping antenna. Problem is those who have them want way too much moola for them.

20 miles? That's pitiful!

My '84 Honda Aspencade with Panasonic AM/FM/40-ch. CB with radio-CB combo antenna, reached 18 miles from cycle to friend's house south of San Jose, Calif. and I had a 80-foot high embankment for 280 freeway just 1/4 mile south of driveway cycle was parked in to contend with. After installation and without trimming anything my SWR was 1.3:1 on ch. 13 which was our riding frequency.

Before I was done I had also mounted 2-meter, 220 MHz and 440 Mhz transceivers on cycle. Mixer units for helmet mounted book-mike input to radios & cycle intercom and audio output mixers with dummy load switches for output to speakers in helmet.

Mounted a 2-inch speaker to rear of helmet to put off cops when they questioned me about speaker(s) in helmet [illegal for cycles then].

I remember when company which manufactured Cobra CBs put out a line of radio/tape/CB units with monitor circuitry that let you listen to stereo and when CB signal popped squelch, circuitry in radio/tape output stage switched stereo output to resistor load and put CB audio into speakers. Press a switch on front panel of radio and be able to transmit as well as receive on channel selected. Reverse switch and be back in radio/tape mode.

Maybe if enough people were interested and would plunk down the green stuff, they'd re-introduce these.

Wild Bill calls someone "...you stupid illiterate asshole,"

Well, Bill, the body of the auto is your ground/counterpoise and acts as the other half of the ideal antenna. How do you think through-the-glass antennas work?

Years ago, a company put out an antenna which mounted to the top of the windshield metal with a tuning box containing a air variable capacitor and an air variable coil. The active wire then came out of the box and attached to the bottom of the windshield frame with a crimped-on lug.

Mounted to my Chevy Vega hatchback windshield and using a borrowed J. C. Penney base unit to set the SWR I was able to reach about 15 miles over relatively flat terrain from an empty drive-in movie parking area to another mobile unit and a further six miles beyond that mobile to a base station with Shakespeare "Big Stick" on single-story house rooftop.

Much like friends in a mobile home park used same Shakespeare "Big Stick" to talk barefoot using SBE IV to people northwestward to Alaska, south to Mexico and eastward through Tennessee. Even though the trailers weren't connected, their combined rooftops gave one heck of a "ground" effect to that "Big Stick." They got about 2-"S" units more at their site than I did with my "Big Stick" mounted to chimney on three story house about six miles north of their site. At that time I was using a CP-400 mobile [H-P 0-30V/0-50A power supply] with 256 channels AM/SSB and tweaked for 6-watts AM and 15-watts SSB. Ahhh, the good ol' days.

Now I just use CB to advise truckers of any problems during canyon commute and to find out anything about their portion of the canyon. Since 1982 I've been mostly on VHF/UHF ham rigs. With repeater linkages I can talk north to south US borders and almost half the width of the country. On HF, using near vertical incident skywave, I can talk in a 600 mile diameter circle with noiseless audio regardless of terrain using only 50 watts and a twenty-foot horizontal antenna which is perfect length for both trailer and motorhome. Problem is that this method is too "new" for most hams and they don't want to be bothered. Eighteen stations with solar/generator power in a three by six pattern could cover the entire nation with crystal-clear communications in case of a disaster which takes out the power grid for the country.

>> > Classes on how not to fry rigs?

C'mon, get serious. If you don't want to fry a manufactured rig then build your own.

Else, why aren't you out in the garage souping up the family car for 0-60 starts in 5 seconds? Whaaa? The wife doesn't want to be splattered all over the dash when your unstoppable rig encounters the immovable object? Just tell her to get a life, you're entitled to do whatever pleases your fancy concerning power and speed.

Things are manufactured for specific purposes. If you don't mind extending the envelope then you shouldn't mind paying the consequences when you go too far. And why is it someone else's responsibility to "teach" the unteachable how not to burn their fingers or bother the next door neighbor with their idiotic excursions into the unknown?

Why is it that everyone wants information for free and then gets pissed off when their equipment fries?

Spend the money on the mod book for your rig and pay attention to the statement that such is not guaranteed to work but IS guaranteed to void any warranty an/or cost megabucks to repair.

Too cheap to pay for proper mod information an/or terminally stupid or else they'd buy "learn-how" texts and do it right.

Some Jap transceivers leave out a diode for those parts of the world that tolerate or permit out of band communications. Whereas in the good ol' uSA, the diode must be in or radio is not allowed to be sold. Several models of Icom-Kenwood-Yaesu have been prohibited for lack of a limiting feature and several others permit you out-of-band operation by clipping or grounding certain parts.

You pays your money and takes your chances with the FCC and its confiscatory practices and fines. As well as its assumption that if you possess an otherwise illegal piece of equipment, then you have used it and are subject to fines, confiscation and even loss of freedom for violation of the corporate regulations you asked to be controlled by.

In Texas, if someone is trespassing on your property, and that means
in your yard, too, make sure they're somewhere where they can't "fall"
out of your property, or drag themselves out, and shoot 'em. Perfectly
legal to shoot a trespasser in Texas... Too bad the rest of the
country doesn't follow suit.

-SSB

On or about Thu, 19 Oct 2000 13:24:53 -0400, Jerry Oxendine
<joxendi@bellsouth.net>, using the forum rec.radio.cb did say:

:I was helping a friend re-hang his 75 meter antenna yesterday. Seems
:a neighbor has been having interference problems, came onto his proper-
:ty and cut the halyard. This is the second one that the guy has cut
:down. So my friend was pretty hot about the whole thing. He saw the
:guy out in his yard and hollered at him from the roof of his shop tel-
:ling him that if he cut down any more antennas, he'd come over there
:and "whup" his you-know-what. Of course, that started an argument,
:threats, cussin', and the whole smear. The neighbor picked up a stick
:and came down to the property line. Neighbor's wife got the situation
:cooled down.
:
:Here's the thing: The interference thing has been going on for some
:time. "Johnny" (not his real name) has tried to reason with them and
:tried to tell them how to cure the problem. He is a radio repairman
:since the late '50s and has an electronics shop. They absolutely re-
:fuse to listen. He has told them to contact the phone company and
:they would filter the line. He has tried to help them cure the TVI.
:Johnny and I went up there one day last year to offer to filter the
:TV. The guy ran me off the property and stood there shouting and curs-
:ing John. His whole thing is that he thinks he can force Johnny to
:shut down his ham station, which is 100% legal, and he will not hear
:to anything else. John could get the whole thing cleared up IF they
:would just listen. But when they are told that the problem lies in
:their own TV, phone, and stereo equipment, they just get mad. So what's
:a fellow to do? He's tried everything to be helpful. And the worst of
:it is that when they didn't even have a phone, it was Johnny who let
:them use his. When "Paul" (not his real name, either) needed to bor-
:row money, he came to John who lent him $20. Johnny has tried to be a
:good neighbor, and now this piece of trash wants to play "I'll-show-that
:-ham-guy-who's-boss-around-here."
:
:So, yesterday, it almost got to the fight stage. I kept quiet. But if it
:had come to blows, I'd have had to become involved to the extent of
:breaking it up by restraining the aggressor. I'm glad the man's wife

:had enough influence to prevent a fight.
:
:This is just an example of how far such things can go between neighbors.
:Johnny has grounds for trespassing, malicious damage. The guy has the
:gall to come onto someone else's property and cut down antenna halyards.
:How do you deal with someone like that?
:
:Jerry

A friend living in Aptos, Cal. has two fireplaces in his house, only one in use. The other had the flue permanantly sealed. He broke through the flue and ran his coax down the chimney, then sealed accordingly.

I still have one of those...a Pearce-Simpson, and it works fine. Matter of fact, it's the wife's favorite radio. Cruising down the road, radio on standby mode, listening to the FM station, cb on your favorite channel, and when a signal comes in, the music stops and your breaker comes through. Also came with a telephone-type handset as an extra mic. Have you ever seen the mic wiring diagram? This thing is a right angle 7 pin male plug. The radio screams.

2194. Light-bulb in Ranger RCI-2900

Newsgroup: rec.radio.cb
Date: 2000-10-19 00:00:00 UTC
From: Scott <2RP789@netscape.net>
Message-ID: <39EF6788.9A68CE6B@netscape.net>
Source record: 56105

Anybody know where/what/how to change the bulb that back-lights the frequency display in the Ranger RCI-2900? I ripped the radio apart and can't find the location of the bulb. There is a tin cover that has 4 screws holding it on that covers the back of the display...is it safe to take it off?

It is a RCI-2900 came out before the RCI-2950..and I don't know if they are the same.

If you know anything, or have some advice - I'd love to hear it!

Scott.

Tim,

Er, not necessarily depending on which unit it is. I have 2 Icom 706s,
as well as a Kenwood TS 50. These rigs have very good AM, and I work
AM on all ham bands. Everybody tells me that the AM quality is good.
With 25 watts, I work the whole East coast on 7295 some mornings and
28.610 at night. Seventy five meters is just a little too noisy for
my 25 watts to compete. Oh, another friend of mine has a Yaesus 890
and it, too, has excellent AM. I didn't catch which Icom the original
poster was referring to, but these are some I know about.

TW,

I LIKE it, I LIKE it! It is, of course, up to Johnny what the next move
will be. I suggested he move the lanyards up the towers out of reach.
That way, the bugger would have to climb up to reach them. Then John
could build a small fire at the base of the tower while he waits for
the law to get there. Just joking!

its not. the real law states there has to be a threat on your life not property. i discussed this with a cop here not too long ago. you cant shoot a guy just because he's crawling thru your window unless you can get on the stand and swear to god you felt your life was in danger and not just you being robbed. its a misconception that you can just shoot any old burglar or tresspasser.

Surely, just as you can legally own a Boeing 747 without a First Class Medical and a APL.

Don't know what you'd do with it if you weren't able to fly it though.

And FCC can't bust in on you, declare that possession of the B-747 is use; confiscate it; fine you 10,000 and throw you in prison for five years for same possession. Which is what they can do to anyone with out-of-band transceivers.

And you thought drugs were bad?

2204. Re: ICECOLD's JOKE of da Day

FUBAR joke of the day.

Older gentleman with a box under each arm knocks on the door of a house of ill repute. The madam comes to the door and asks what he's selling.

Madam, I'm not selling anything. I'm here to enjoy the benefit of your house.

Well, you look a little too old to be doing this. Why don't you try next door.

Madam, I've been told your girls are the youngest and hardiest of any hereabouts.

Okay, c'mon in.

He enters and she shuts the door behind him and then asks, "What's in the boxes?"

He turns to her and says, "Madam, I've had many women over the years but there are two things I just can't stand so I've brought a box of cotton balls along with a box of condoms. Before I start I'll plug my nostrils and ears for I just can't stand the sound of a screamin' woman nor the smell of burning rubber!"

Having one in your car, hooked-up, implies intent. Besides that, he'd take it anyway and you'd have a devil of a time getting it back, wether you were in the right or in the wrong, so why subject yourself to that? :-)

Jeff

But anyone with half a brain should be able to place it where it can't be seen.

In California, speakers in helmets is illegal so I mounted a special design speaker to the rear of the helmet. When cops asked if I had speakers in the helmet I could use misdirection and point to the rear-mounted speaker as being the method of getting sound inside the helmet. I could turn up the stereo sound and let them hear the music coming from inside the helmet.

Worked every time.

Once a highwayman got pushy so I pushed back [respectfully, of course] "Let me see inside that helmet!"

"Well, sir, before we can continue with this in-custody interrogation, I require three things you are oath-bound to provide to me.

First, what's your probable cause for this intrusion on my private life?
Second, I require a Amendment Four, judicially-returnable warrant before
anything other than a Terry Rule patdown takes place, and;
Third, I require that my counsel be present before any questioning takes place else I wouldn't know how to answer your questions, much less if I am even required to."

"Get out of my sight!"

"Thank you, sir."

2206. Re: Local vs FCC Enforcement

Newsgroup: rec.radio.cb
Date: 2000-10-19 00:00:00 UTC
From: Dean Arthur <dearthur@silverstar.com>
Message-ID: <39EF60BC.3C5F@silverstar.com>
Source record: 56117

This kind of police misconduct brought about the Supreme Court holding in Brown v. Mississippi. A black young man climbed in the window of a older woman's house, leaving fingerprints on the sill and raped the woman. Without her glasses she was virtually blind but in fighting the assailant she believed, from the skin tone she felt with her hands that he must have been young, maybe in his upper teens.

So the local constabulary rounded up every male black from 14 through 30, took them to the county seat and finger printed them til they found the one whose prints matched the set on the sill. Charged him with the crime, convicted him and sentenced him to life in prison.

Supreme Court overturned the conviction based on the violation of the Fifth Amendment and the failure to obtain a warrant based on probable cause.

Much the way the Miranda case came about. Miranda was arrested for murder. Police had sufficient circumstantial evidence but in their attempt to get Miranda to confess, they resorted to putting lit cigarettes out on his body, sleep deprivation, filling him with coffee and cookies but keeping him cuffed to a bolted-down char so he soiled himself and ignoring his pleas for an attorney.

Supreme Court, using the earlier case of Esposito v. Illinois, held that an in-custody person could not be subject to any form of abuse or denial of an attorney or any information arising from such abuse or denial was absolutely inadmissible.

So, now we have the Miranda warning whose use has been quite well watered down by the Supremes. It takes the video-taping of such abuse to even get the sheople warmed up against this abuse. Without it it's your word against the elite enforcers.

Actually best to leave PC supplies for PCs and get an Astron supply.
Either a linear or a switcher with minimum continuous current supply of
the maximum your unit will draw. The ICAS will then cover you for any
over or undervoltages that would otherwise fry a power supply.

The neighbor came into your friend's yard AND damaged his property,
despite all attempts at harmony? I forget what state you are in Jerry,
but I'd check my state laws. Possibly file a harassment, vandalism,
and/or trespassing complaint so at least it is on record, so the next
time it happens, the law is clear on why the guy is full of buckshot.
Here in the 'pile, it is permissible to use deadly force when protecting
your family or personal property on your land, but one does not wish it
to come to this over radio. I like the dog suggestion. I have a Shepherd
that came from Bonn, and a fenced yard. Critters from the swamp
occasionally come in, but they never leave.

happens to about 1 out of every 1 million holders of out of band gear if that many. hams can only state less than a handfull of cases that 11 meter operators have been busted in recent years and the ones that were busted is because they interfered with ham radio. stay on 11 meters, dont bother your neighbors much, and hope you dont have any snitching hams close by and youll never have a problem whether you run 4 watts or 40,000 watts all day.

I'm afraid I don't get the connection here. Here's a legal operator running a station in the same place for 40 years. A few years back, this "step" son (not really related to the backside neighbor who owns the adjoining property) moves in with the old fellow and begins showing his backside. The REAL neighbor is elderly and ailing, so here comes "Paul" to the "rescue". Actually, indications are that he is waiting for the old fellow to kick off so he can register a "claim" on the property. So he complains about interference to their phone and TV. Johnny responds with suggestions as how to correct it. He won't listen. So far, he has damaged 2 antennas which we have put right back up. The last one hadn't been used for a number of weeks. But dumb butt doesn't know the difference. Now Johnny is right mad, and I don't blame him. There's no telling what might happen the next time he trespasses and damages antennas. He hasn't jumped on me yet, but the only advice I can give him is to think like Roy D. Mercer. He needs to ask the question: "Just how big a boy ARE you?" LOL!! Nah, I don't think he'd do that. But I'd be mighty hot if somebody dared to come on my land and mess with my stuff.

Some time back I began to have trouble with teen agers coming in my driveway and "scratching" off as they turned around. Then they got bold and cut doughnuts in my front yard leaving ugly ruts. I got some boards, filled them with nails and buried them in the yard with only the nails exposed. One night a Toyota 4Runner came down the street with its lights off. I had my house lights off, too, and I watched this kid come creeping down the street. He drove off the street and into my yard and GUNNED it. POP! PSHEEEEEEEEW! POP! PSHEEEEEEEEW! He flattened at least three tires---those HUGE knobby things. Not wanting to explain how he got the flats and what he was doing in my yard, he drove, er, uh, limped home. Never had that trouble again. '

what does that have to do with a person using any type of equipment on 11 meters be it out of band or not? you pulling up to my property to damage my equipment is malicious intent, but me talking to my wife on 26.865 is not yet it bothers you so bad. why is this? please dont give me the line about these freqs being assigned to other angencies because they have long been abandoned and any monitoring wil quickly prove that. if your running any type of ham equipment worth a darn then youll never know were on 11 meters if you dont come listening. i have several high powered am stations in my area that run 27.025 and on my yaesu i never even know there talking while i'm on 27.555. now if i was to use a galaxy or cobra theyd be all over my dial but i'm assuming your using something with a little channel rejection since indeed you say you are a ham so why care so much about what we do on 11 meters? please dont duck the question i really want to know why you care and i'm sure others do to.

Honest question and not chain-pulling: does this really happen? Maybe I hang out in the wrong amateur circles but the prevailing opinion is basically who gives a hoot. Because I talk for a living, most of my operation is key and keyboard anyway and not that much on ten meters so I am not personally the one to ask but beyond a few comments on some of the ways ex or current CBers give themselves away on the ham bands (an incredible reluctance to give one's QTH being the biggie) it is pretty much ho-hum.

The amateur service has been plagued by status games since before I gave a damn but these have been slowly dismantled. The seabag lawyering continues apace, however, so it is certainly possible.

Do you know of any specifics???

personaly,i prefer AC when I do key, I will have a bird on the table on thanksgiving day so traveling 1/2 way across the country to a keydown is not in my itinerary
If you are around next season you can look me up at the The Camp in Jacksonville NC i will be keying 2,4,8,16 and ac1 4-10

besides why would I want you to furnish my box mr brass monkey Is that not a conflict of interest? i would prefer 1 antenna and the box of your choice

oh i agree the neighbor is out of line. my point was he cant tell your friend what to do on his property, and neither can hams to us cb'ers on 11 meters yet they both keep trying. i'd beat the guys ass for real. you wouldnt have been a good friend at all if you would have restrained the agressor like you said in a earlier post. seems to me they need to settle it and man to man usually does work and get it out of there sytems as long as no weapons are involved. men have been doing it that way for thousands of years.

Jerry,
Having been there, and ended up in about the same situation, there is probably only one way of handling it now. That is to force the issue, take the neighbor to court for a 'protective-order'. That would prohibit the neighbor from having anything to do with your friend, so at least if he cut an antenna down, he would have major problems.
Also, what would happen would be the neighbor would get a 'protective-order' to prevent the RFI. This is what you want him to do! There will be a hearing before a judge, where the particulars of the RFI would be explained. At that time, your friend should point out that he has made an effort to solve the problem and had been refused. He should also point out that RFI is in the sole jurisdiction of the FCC/Fed.Gov., and that local courts have no jurisdiction in RFI matters because of Pub.L. 97-259. At that point the judge would normally postpone a decision on the neighbor's protective-order till he could review the law. Your friend would have one more court appearance where the neighbor's 'p.o.' would be dismissed. Takes longer to read this here, than it does for the matter to be settled in court.
'Doc

Some years ago when the FCC got involved in TVI cases, there was a lady of similar persuasion who pretty well admitted that her main aim was to shut down the station rather than get it fixed. The 17th District engineer at the time looked like and did a great imitation of Adolf Hitler; he won.

Lacking that, you are going to have to get some third party intervention. My first two acts would be to file a vandalism report with the local gendarmes, as publicly as possible and to obtain the FCC publications on RFI and make his wife, apparently the only sane one in the batch including your friend, a gift of it. It isn't going to say a blessed thing your friend hasn't already but it comes with an official-looking seal.

You may have a mediation service available locally, use it. There may be a common trusted third party, a pastor perhaps, that can be utilized to take the heat out of it.

While the friendly phone folks may filter the line, there is an oddball chance the phone itself, purchased no doubt, will be doing it in the network within the phone: good as in luck. From your description, the power lines are the most likely culprit in the TVI and likely the phone and stereo as well; bet you share a line transformer -- might even guess the phone line is grounded to the electric meter box. If you are not tearing up your own set, might it be because the neighbor's set is on the side of the 240 volt line with the station while your friend's set is on the other? If so, a long extension cord to a socket known to be on the other side might be useful. So would a two-prong cheater to break the ground loop. Sum and substance: are you really sure that the problem is not in the 75 meter station -- or at least curable there -- before you sally forth and come in fifth. At the very least, having a set in the house that is not affected is a major point in your favor. Might you find a way to avoid any possible coupling from the antenna to the power lines?

Start the paperwork in terms of a log of complaints, incidents, and what you have done to alleviate the problem; you may need it.

Glad to see the seabag lawyering is as endemic at 27 MHz as it is in the ham bands.

No charges were filed because the man killed his OWN son.
Punishment enough.

If the one who was crawling in the window was the NIEGHBORS
five year old son then the man would of been charged even if he swore
he thought his life was in danger. You must be able to convince the
legal system that your perceived threat is reasonable.

I have a MR4 that over the years has been modified and rebuilt a few time. I think the only thing left origional to it is the mounting plate. Elements were replaced with larger tubing making it more rugged and boom length was increased. Spacing was based on a yagi optimazation program. Most obvious improvement was the front to back ratio. Opt program says I should have gotten another db of forward gain. I think the final boom length was about 24ft. Opt program also said I should get about a 10db improvement in front to back. I would have to say this was probably pretty close. Last maintenance that was done on it I replaced the quad type reflector wit standard Yagi type element. This let me use the antenna vertically on 11m and horizontally on 10m.

Boom length made the most difference. I think a MR4 on a 24ft boom probably does as well as a factory MR6.

2236. ?? Can Someone Recommend a Bi-Linear Amp?

Newsgroup: rec.radio.cb
Date: 2000-10-19 00:00:00 UTC
From: Tim Christiaens <timinvancouver@direct.ca>
Message-ID: <h51vus02hgd7ossc4ll8kh0ucb140qbqa8@4ax.com>
Source record: 56147

Ok. me newbie, completely know nothing about amps.
Want some CLEAN 200w+ Bi-Linear ,must be variable 50w and up for am and SSB.
Since it would be used for the base would prefer a solid state 120v set-up, but might consider a mobile type 13.5v.
Recommendations would be greatly appreciated w/ info on where to purchase and or link where I can learn about them appreciated.
How do these units get hooked into the antenna system? Is it just a matter of motorola PL-259 in and out or are they complicated to hook in?
Well Thanks in advance again posters!
Keep up the good work!
Tim.

Is your antenna grounded? My noise level went down - I almost never use my anl/nb. I used it all the time before. My swr from 25.165 - 28 MHZ is 1.1:1 My tuning rings are up as high as they will go. For 10 meter the swr is alot higher - but for 11 meter it's great.

Cat,
As long as the amplifier is tuned correctly, not over driven,
and the mic-gain not excessive, there should be no particular
maximum safe time to key the amplifier. Any normal conversation
length will be safe using SSB.

I see no argument happening, at least from any people that have seen as many butchered radios as I have. I guess that's to be expected when you like to pick-up older stuff like I do, but man-o-man, why do folks think they need all that audio in the first place? It's not like they're trying to talk on the bowl or anything.

Dean,

I think the MURS is limited to 2.5 KHz deviation. I don't think there is an overabundance of MURS gear on the market with that narrow a bandwidth, but if so the ham units may be hard to copy. The same deviation ratio (or near to it) applies to 70cm ham gear and FRS units. The jury is still out on this one.....

The FL-2100B amp bias switches to class c in CW, so you can dead key at 500 almost continuous too. They are a great amp.

Here is the way to go about this, I had a similar problem with trespassers. Have your friend put up NO Trespassing signs around the property in plain clear view. This covers your friend of any legal issues of notification. If the neighbor comes onto the property, hold him at gun point till the police arrive, and press charges! This solved the problem for me. I put up the signs, and wrote my neighbor a letter, informing him that I would no longer tolerate his trespassing and that if I caught him again I would call the police and press charges. He did it anyway, but not again after he was arrested and spent a 2 days in jail and paid a $500 fine. At the same time, I would do everything that you can to discourage the neighbor, place the lanyards higher up the tower. This shows that you have done everything within your power to avoid confrontation and at the same time protect your property. Some people just have to be dealt with, and no type of diplomacy will work.

Sure they would.
Galvanic Skin Response will change the impedance of your mic. As you put items of cloths on, the impedance goes down and the mic sounds different. I think Swan used to make an add on meter that could be modified to detect this. Usually used when you wanted to find all those really great looking CB "Mommas" that we have all heard of. <big grin>

A typical SWR meter depends upon being calibrated in order to read
accurately. A constant signal with the A.M. carrier will establish
this calibration signal.

SSB has no power without modulation. SSB with modulation has
power that varies at a unpredictable rate that can not establish a
proper constant calibration reference. Therefore check your SWR on
A.M.. Once done it will accurately reflect the proper reading. Even
when you are in the SSB mode.

"This is not quite correct, just close enough to get someone in
trouble."

It should read by whatever means is APPROPRIATE. Using deadly force
to stop a child that is merely trespassing and is obviously of no
threat to physically harming you does not justify inappropriate force.
Shooting someone for this offense would put you in jail. Even in
Texas.

>very recent case in Dallas, a man was digging through trash cans behind a

>
>We may be backward in Texas from your perspective, but around here we view
>it as merely protecting your property.

If someone is merely trespassing and poses no realistic threat then
you have no right to use deadly force. Papering by a neighborhood
girl at 1:00 am does not justify one being shot. Even in Texas.
If you view killing as an equal countermeasure to papering then I feel
sorry for everyone who has to put up with your obviously out of whack
thinking.

Source record: 56169

11.5 and 12.5 are total bandwidth. An FM signal is in theory infinitely wide but is usually said to be 2.5 times the deviation and, of course, the apparent deviation is in both directions. So a 2.5 KHz swing translates to 12.5 bandwidth. This narrow a deviation does require some very good frequency stability and accuracy to pull off.

This will probably empty some warehouses of what has been called in the past 'color dot' business band intended for the lo-grade business usage that was the original intent of CB. Including it under Class D simply flushed licensing requirements. That is about its only connection to CB as we know it.

If everything from old rockbound trash to opened-up amateur rigs shows up, the result will not be pretty.

Time to throw away that K-Mart card table you are using for an operating position; these beasts are Heavy.

At the time they were built, 11 meters was a ham band so coverage of the lower 22 channels -- the old ham band -- is already on the VFO. Beyond that, you are on your own. Don't forget that you will need to switch from transmit to receive and the DowKey coaxial relays used at the time are not cheap if you can find one. Get the whole junkbox, not just the Viking II.

Problems? No more than restoring any other piece of 50s technology. Yes, most things of that vintage are in museums and when it is all over you have the newest 50 year old gizmo in captivity. The caps are dry, the controls dirty, the tubes shot -- minor items like that. And you do not get replacement parts from your local Radio Scrap.

Ain't my cup of tea and I was around when they were new. I even know how to work on them.
They do not call them boatanchors for free.

I have to agree here.... Just cut a small hole in the ceiling and
thread your cables down. Slip a white PVC pipe over your cables and
you can paint it if you wish a finished look. My attic dipoles drop
right down to the shack..... Why would you want to mess with running
any cables through the wall? Simple is best.

Source record: 56018

I am using a trunk lid mount and I am concerned that if corrosion sets in I could lose my ground and blow my amp.! Since these mounts have screws that pierce the paint, I do not feel safe living in snow country. My question is, since 3" from the mount my coax is safely in the trunk, can I peel back the outer insulator and also ground the shield to the trunk lid (3" down the coax from mount)? I have always wondered why the shield must ground through the mount screws and not grounded in this manner instead. Does the shield have to go all the way to the mount? Tell me if it is ok to ground in this manner so that I can feel safe not to blow my amp. when I need it the most!

A little while back I asked about a mod for the galaxy 77 using a diode. One site had it as a 1n4145 and when I asked if their was a simple replacement, I recieved many replies with different diodes. I went out and purchased the 1n4148 thinking this was one of the models I had been told but I cannot find the thread and confirm this.

Which diode can I use, it doesnt seem as it would be that critical??

2282. Re: ? Antron Improvement W/ FirestickII??

I have an I-Max 2000 myself, and I tried the FireStik-II on the top section, but to no avail... (It didn't do anything, except bring my SWR's up, and yes, I tried the tuning rings......) I then tried it on the neighbor kid's A-99, and it did help... (Somewhat, It picked up more noise, but he did get a LITTLE bit further out...)
BTW, Thanks, Jay in the Mojave!!!!!
This G-Man has been busy, but I PROMISE the postcard I promised you is going out this week...

>I have a I-MAX 2000. After seeing the add for a firestik for the a99 on the
>Firestick web site. I replaced my 1/4 wave top section of my I-MAX with my
>5' FirestickII. I read the 1/4 wave top section was resonate above 27 Mhz.
>So I removed the screw of the firestick. To my shocked surprise, I noticed
>I had increased bandwidth, equaling lower swr, better power dissipation
>(higher and more even output across the band), better local and skip
>transmit and receive. I hear more stations now than I ever have before. I
>didn't have to change anything else to my I-MAX and yes the threads are the
>same. They have done this upgrade themselves, that's where I got the idea.
>Try it - you'll like it. I didn't believe the add I saw, that's why I tried
>it. The freaky think is, that it did work [REALLY WELL]!

>what happened to exportrus?

I tried to call them about a month ago for several days in a row, but nobody ever answered the phone. I sent them an email with my phone number and about a week later they emailed back that they are real busy, but someone would call me. Never happened. Go to Express Electronics. They always answer the phone, will answer all your silly and not so silly questions and will match any price on the web. Its a no brainer for me, I have been very happy with my dealings with them. My opinion, YMMV. Nick

Hi All,

Recently I came across a few Starduster/Skylab Base CB Antennas and ordered several for me and my friends. I sold all of them but one as one guy who I ordered for backed out.

Anyway, I'll sell it, new in the package, delivered USPS Priority anywhere in the US for $63.00.

I can accept PayPal or if need be will wait for payment.

First come, First Served.....so if you are interested, e-mail me now.

Thanks and Have a Great Day,

Mike - Cape Coral, FL

2297. Re: Ham Equipment

Newsgroup: rec.radio.cb
Date: 2000-10-20 00:00:00 UTC
From: Bill <wdecker1@rochester.rr.com>
Message-ID: <IbWH5.53734$JS3.7817860@typhoon.nyroc.rr.com>
Source record: 56270

Maybe things have changed, but in '69 the fact that there was in my possession equipment capable of operating on frequencies for which I was not licensed, and with RF emission capabilities in excess of the limits for Class D, and that this equipment was in fact connected to a power source and a device capable of radiating transmissions made by said equipment (an antenna) was sufficient cause for the presumption of intent to operate in violation of Part 95. Penalties included fines and/or immediate seizure and forfeiture of said non-compliant equipment.

Again, this is subject to interpretation, but as a fine point of the law, possession of "bad things" in a ready to use status can and has been considered a violation in and of itself. If one also gets caught actually USING it, that is a separate, and usually additional, citation. Since the days of multiple FCC monitoring stations all over the place have gone the way of all good budget restricted entities,the enforcement of Class D rules, and the CB band as a whole, has been thrown to the wolves (That means us, folks). It doesn't mean that the laws aren't still there, like the "no horses on Main St. on Sunday" laws still on the books in small towns all around. I would think that if someone was into a couple of "gallons" and was dirty enough to bother the Ten Ten guys in a contest, or maybe splatter the Mayors' sister's cordless phone, these rules could get polished up in a hurry!! That's why in the old days we... I mean "those OTHER guys" who ran kilowatts or even 100 watters used to have pretty elaborate ways of putting them in line but out of sight (like in the basement rafters or up on the top shelf of the closet), or simply unhooked them and put em away a lot.

It's like the dope laws, if you have over a certain amount of the substance, it changes from "posession" to "Possession with intent to distribute". You don't have to sell anything to be termed a dealer. You don't have to transmit to be a "bootlegger". Again, rules are subject to interpretation. What you need to remember is that we don't get to do the interpretation, "THEY" do!!!!!

Just my six bits worth.

Tim,

Tell me how a properly aligned CB can sound better that a properly aligned HF rig? If a radios' prime function is to be 11M AM, and it is tuned thusly, wouldn't a radio with generally better construction and design, using closer tolerance components and standards, be capable of excellent results? A lot of the poor sounding HF rigs are working with mikes that are better suited for SSB phone, and most have the "general coverage" mod done, and thats it. Also, using speech processing may or may not be a great idea on AM as well. I think that a solid state radio is a solid state radio, and as a general statement, all should be capable of performing just fine once they are "set up" properly.

Source record: 56282

I took the screws off that held the face of the radio to the chassis so I could get a better look. And I took off that tin plate..it apparently is just on there to shield the display from RF (i am guessing). For the life of me - I can't find any bulbs. From what I remember, they shine in from the center bottom or top.

Anybody know what the wires colors are or have some clue. I'm no expert, but I know what a bulb looks like - I can't see one from the back of the face plate!

Help!

Scot.

Gee, do you think that maybe some of those "repeater nerds" just MIGHT be
operating on other bands besides VHF?

MANY newer hams run both 2m and 10m, now that the conditions are so good. I
guarantee that 1KW on Channel 6 (especially at 120+% modulation) will wipe out
10 meters for a several block radius.

Dean,

I agree that the thru-glass antennas are nothing more than dummy loads. I have one that I use on a Rad. Shack CB. No range, but that's the reason for using it. I don't need more to talk to the next vehicle in my "convoy" group or to find out why the traffic has come to a halt.

Ironically, when I bought mine ($10 at Walmart), I checked it with MFJ Analyzer and found it was resonant at 28.310! The stinger was way too short, so I had to make one. It does fine for what I use it for.

They are good-looking and that alone makes me almost ready to indulge in a resurrection. Just to give you a start, price (or find) the electrolytics in the power supply and price the finals and driver tubes. The caps are virtually certain to be bad and the finals will be the most expensive tubes in the unit. I believe they are 6146s. The modulators are 807s which is a 6L6 with a top cap and a funny base. FYI, 6146s are really pissy about grid current. Draw too much and watch the grids melt into the base or at the very least become physically distorted so as not to work worth a shit. Not the tube for the terminally greedy.

I am assuming that you get the external VFO as well. Darn near worthless without it. There were some audio mods published for it. If it makes you happy, it will love a non-powered D104. See if he bought the matching antenna tuner as well.

Of all of the rigs of that vintage, the Viking II was near-broadcast quality construction and is one of the very few worth the time and effort.

On the other hand, it is a bit of overkill for about 80 watts out on 11 meters.

You'll rarely find a trucker on SSB, unless he's shooting skip... Most
of us just leave it on 19 to get our bear reports, etc.... and switch
off to another channel if what we're talkin 'bout wouldn't interest
most everyone else.

Of course, I have run into the odd driver who had an SSB rig and we'd
go up to 38 LSB or something and chat... mostly because they were
usually eating my dust, and SSB seems to get out further.

Just my two cents. Your mileage may vary.

-SSB

On or about 20 Oct 2000 01:57:33 GMT, twhite8611@aol.com (TWhite8611),
using the forum rec.radio.cb did say:

:I am planning to buy another CB for my work truck and was thinking getting a
:one with SSB. Is there enough traffic on SSB to justify the expense? I only
:want to listen to and occasionally talk to the truckers and others while I am
:on the road.

The Grant XL will actually do 28.085 with the standard mixer crystal
and tuning..

replacing the loop mixer crystal and retuning the radio for the
desired frequency range might allow the radio to go from 28.3 to
28.5.. but then you sacrifice receive and transmit power on the CB
bands, or lose the CB bands altogether.

So it's a toss-up... Do you want to use the radio for 10M HAM, or 11M
CB?

-SSB

On or about Fri, 20 Oct 2000 09:25:44 -0500, "Paul Knight"
<paul.knight@prairiecomm.com>, using the forum rec.radio.cb did say:

:Hello! Can the Grant XL be mod'd to get up to the 28.3-28.5 portion of 10M?
:All the mods I've found seem to top out at 28.035 or so.
:
:Thanks,

no, i know these guys are techs only. there the same group that used to freeband around here on 27.455 until the no code liscence came about and they became holy warriors fighting for the radio waves. i doubt they could pass a 1 wpm code exam. they probably knew the VE that gave them the test because even a radio shack study guide seems out of there league.

>Gee, do you think that maybe some of those "repeater nerds" just MIGHT be

I understand what you are saying, Tim. I feel certain circumstances could absolutely affect the outcome. I feel the Fla. laws concerning guns are quite similar to that of Texas and it would not be all that difficult to show your life was in danger. We to, can carry a gun, without a license or permit, on our person, but it may NOT be concealed, unless, a permit is obtained. It is quite legal to walk around with fire power strapped to your hip, as long as it is in plain view. That is why so many signs exist on bars and other establishments here proclaiming, "No Firearms". Concerning carrying a firearm in a vehicle, we have what is called the "3 step law". It must take you 3 physical steps to fire. Example: Pistol in glove compartment, opening the glove compartment is 1 step. Pistol has a clip in it, step 2 would be cocking, which would load the chamber. Step 3 would be pulling the trigger. In your own home, it's up to you. If someone is crawling through a window in the middle of the night, and my wife and daughter are both in their beds, guess what? Play time with doggy first. But if he somehow got past him, I do not think it would take long for me to prove that I felt my family was in immediate danger. As I stated, circumstances dictate everything, but in this state, someone crawling through your window in the middle of the night, is usually sufficient grounds for a justifiable shooting, creating a scenario that the citizen was in a clear and present, dangerous situation, which caused imminent fear for his/her life or family members. That type of thing is not so infrequent in Fla. anymore. More and more folks (read: yankees. Sorry, couldn't resist :)) are moving here on a daily basis to start a new life, only problem is, they return to their old life once they are here and proceed to tell us "the way they did it up north". The house burglars and stick-up artists of the suburbs up north try it here, but their careers are drastically shortened due to many of the victims packing heat. Just this month an elderly, local woman was accosted in daylight hours outside an Eckerd drug store when a punk sprayed her with mace, stole her purse, and took off on foot. A packing witness shot the punk as he was running away. No, he wasn't killed, but no charges were filed. If one is in the commission of committing a violent felony, deadly force may be used to stop the perp. I guess "violent" could be open to interpretation. One more..... a guy had his SUV carjacked at a stoplight in Tampa one morning right before Xmas last year. As the punk was driving away, the guy, who was a retired PI, opened fired as the vehicle LEFT the scene. End result...driver, with a history of priors, dead. After an inquest, no charges were filed. Clearly, the guys life was not in imminent danger, as the punk was driving away when the shooting occured, but the gist of it is, the DA decided to let it roll.

I have heard of drilling a hole through the glass and inserting a copper wire to connect the outside to the inside mounting then the antenna works fine. That's the only way I would use one but a magnetic mount is better period.

Kitchen Signs

1. A messy kitchen is a happy kitchen and this kitchen is delirious.

2. No husband has ever been shot while doing the dishes.

3. A husband is someone who takes out the trash and gives the impression he just cleaned the whole house.

4. If we are what we eat, then I'm easy, fast, and cheap.

5. A balanced diet is a cookie in each hand.

6. Thou shalt not weigh more than thy refrigerator.

7. Blessed are they who can laugh at themselves for they shall never cease to be amused.

8. A clean house is a sign of a misspent life.

9. Help keep the kitchen clean - eat out.

10. Housework done properly can kill you.

11.Countless number of people have eaten in this kitchen and gone on to lead normal lives

12. My next house will have no kitchen --- just a vending machine

Cross-posted to: rec.radio.scanner,rec.radio.cb,rec.radio.amateur.antenna,rec.radio.amateur.misc

In my turf they just run the cable outside of the house and use one of those bad-ass 18" long drill bits to -get into- the house. I think it makes a mess of the brick work and would never do it myself. I managed to wire every room in my pad without any wires being -seen-. It just takes a little more thought and effort but when it's your own place it is worth it.

My apologies for painting all cable monkeys with the same shit-covered brush. :)

Well honestly I can't say I have been there,
but can you say you have been on Cal State
Highway 35, or 9 or 28 or 88, how about
4 or the ever loving 49. Then there's Highway
89, from lake Tahoe all the way up to Chester
Ca., 146 miles of twisting, canyons, river running.
Now 26 miles sounds great, but when you can
have 146 miles of pines, rivers, and little towns like
Maybery RFD, well my friend.....I just
can't see that Aspencade dicing it's way through
there.

The Landshark

If you're concerned with omnidirectionality, do the following:

Remove the cophasing harness.
Get a length of RG8 or better coax to go from your passenger side
mirror antenna mount to the back of your radio/amp
Put a decent antenna on there. (I used the 4' Wilson Silverload on my
'120)
Clean your antenna and ground connections on the mirror mount (That
white crusty stuff on the aluminum, and rust too. get it all out of
there)
Turn it on, tune the SWR, and enjoy.

Running cophased (two antennas, one radio) will cause directionality.
How much you "tilt" the antennas won't have anything to do with the
directionality relative to the ground, except perhaps to change the
front/back transmit and receive strength.. You'll still be deaf on
your sides.

One antenna, on the passenger side of the truck, and be done with
it... Simpler, easier, cheaper, farther.

Just my two cents. Your mileage may vary.

>...it will love a non-powered D104.
>...the Viking II was near-broadcast quality

The Viking II is a beautifully built transmitter with
a pair of 6146's in the final RF amplifier modulated by
a pair of 807's. It operates on 160-10 meters at a DC
input of 180 watts CW and 135 watts AM phone.

Built specifically for the Amateur Radio market in the
early 1950's, it has even seen use in commercial broadcast
applications. The price class was $280 as a kit and $340
factory assembled. The Johnson VFO was designed to match
this transmitter as well as its predecessor, the VIking I.

You should also look at the Valiant. It has the same
high quality construction as the Viking II but it has
a built in vfo with your 11 meters on it. It also has
four 6146's in the final RF amplifier modualted by a
pair of 6146's. The vfo also covers 160 thru 10 meters
and it needs no antenna tuner because it comes with a
Pi-network output that matches 50 to 500 ohm loads.
With all those tubes it has a power input of 275 watts.
I used a non-amplified D-104 with a crystal element.
This is the epitome of high level am modulation.

I just looked and found one on ebay for sale right now.
If I was looking to get back into am, this would be
the transmitter I would buy.

That's my two cents worth... Vestibule

No. Not if you intend to keep the cb band also.
You can change the loop mixing crystal to put it
up there, but you would have 10 meter radio only.
I've done several 148's this way. They make good
10 meter radios. Just order the crystal from
ICM, retune everything, and you're done.

Agreed. But if you must go with co-phasing, you might want to add about half the coax length to one side and fiddle with it. Sounds like you have the only co-phased array in existence that actually functions as one -- monumental lobes front to back and nulls to the side.

If you are dragging a big box around there is also the chance that it is a parasitic reflector in the caper and is giving you an even more monumental lobe forward thru an accident of spacing.
One ancient CB base antenna used three elements to do exactly what you describe except they did it on purpose.

There is no doubt that SSB and Twistedhed have the right idea in general. In a specific situation, you might find rotating the lobe(s) a bit might better serve your situation. SSB hit another thing on the nose, clean it up and make sure it is working as intended before and after doing a rip-tear.

Good luck.

The final frontier of true amateur radio is antenna
building. Given that, common sense will lead you
to all the ham radio publications that are available
on the subject--many of which are available for free
loan at you local public library.

Good luck and have fun.

Only one thing to say, superb plate modulation!!!!!!!!!!! Ok maybe three words. I picked up my Viking for $50.00, to it to #245 AKA Black Daddy and he replace a bad xformer got her up and running for a mear $150 more. That bare foot Johnson's audio used two cut through the DX on the Bow with just 50 Bird wattsl! Something about that plate modulation and that warm smooth bodashius tube sound, no two ways about it! Needless to say I sold it, two many radios and I have my sites set on a the big 500.

Wrong numbnuts. Hams only turn in CBers if they interfere or transmt
where they don't belong. Like on 10m.

>>Johnny has tried to be a
>>good neighbor, and now this piece of trash wants to play "I'll-show-that
>>-ham-guy-who's-boss-around-here."

He's easy to deal with. Have a lawyer contact him about
trespassing, harrassment, etc. If the ham's station is clean and
properly set up he's got nothing to worry about. He's federally
licensed to operate. The local law enforcement has no say what so ever
about the ham's operating.

you state what you know i'll state what i know. i know of more than one ham that has tried to track down and report big strappers on channel 6 for the sole reason of them running a amp whether it was bothering them or not. some of the local 2 meter repeater nerds used to think it was funny to try and ruin peoples life over them running amp when there is no way in hell it was bothering them on the vhf bands, they were just looking to play rf police man. like i said before 99% of all good hf rigs wont have thaty problem anyway.

> Wrong numbnuts. Hams only turn in CBers if they interfere or transmt
>where they don't belong. Like on 10m.

Here's a design for ya, you want a full wave length..

Take two 204" wires connect a balun betweeen the two them. Take your coax and fix the braided parts to one center end and then attach the solid wire portion to the other "center" end. it's a dipole.

This is not quite correct, just close enough to get someone in trouble. What the law states is that a home owner can protect himself, his family, and his property after dark, by whatever means might be available. In a very recent case in Dallas, a man was digging through trash cans behind a fence on city easement. The homeowner got him with a shotgun from about 40 feet. Must have been some kind of shotgun, but anyway the guy was killed and the homweowner was no-billed.

In my case, I finally got the girls to stop papering my front yard to impress my son after I let the word out that I was aware of the law and that it would be a tragedy if I had to kill 7 or 8 kids in my front yard at 1 am.

We may be backward in Texas from your perspective, but around here we view it as merely protecting your property.

I don't care what the others say....you can't check swr accuratly on SSB ..... You need a carrier and a steady signal. check it on am or fm and that will check your antenna.... ssb will not change the swr one bit.

Is that a metal cased 3 legged transistor? Is it out of an older
23 channel mobile or maybe base? If so, I have seen these before.
Does the "F8" look like it was marked with a black magic marker?
(instead of the normal small fine print of part #'s) If so this
is the final transistor in an older radio. Tell the make and
model of the radio and someone can look it up in the Sams for you
then cross it to several transistors that would replace it.
Another poster mentioned it was a diode. In your case,I believe
it's not. By the way, if you can't find one I have some but you
need to post the radios make and model first.

Well thanks for trying Jack but all that page shows is items for
the Yaesu FT 101 series. I need the FT401B schematics. Even the
link to the Yaesu home page didn't help. That is just a Japan
picture page. I don't want to order the manual from Japan. Trying
to find it here in the states. Thanks for trying though!

One last post. There are a lot of different designs. I don't care if it is a crystal radio, there is a reason for the components in the particular design. How can anyone think that by clipping a diode or resistor they are going to get a heck of a lot more perfomance out of that radio? Why would anyone design a radio that would be crippled - except for one little component - or that the performance could be enhanced tremendously by clipping a component or adding one or two components? Come on guys, get with it! Think about it!

TS-440 sounds pretty darn good on AM with a Heil mike, ALC where its
supposed to be, and not over modulated. I have been told on many occation
that "it sounds as clear as running water."

There is no cb on this planet that sounds better
on AM than my IC746 using my SM-20 mic as I've
properly tuned it with other special hardware for
clarity and forward power.

You have too much RF entering your skull to
ever consider that stupidity.

Greetings!

Reading the thread, I don't think anyone covered the basic question...

When you check SWR on AM - you have a carrier to calibrate to. So you have a reference power reading to compare the reflected power to, and you see the "ratio" end result, your 1.8 SWR.

Why doesn't it work on SSB? Well, it does, just remember that you need to "Modulate" or put some power into the meter under Forward/SWR cal and SSB doesn't produce a "carrier" you have to modulate an audio signal to get power out the radio and thru the meter.

SSB produces more power within a narrower range and since you are using some form of audio within this power envelope, it's not going to be very steady to get a good accurate calibrated reading to check for SWR. You're going to get confusing results, unless you have the proper Audio Frequency generator laying around in the closet or in a cupboard to get the proper "reference" audio level to check SWR on SSB.

Since SSB isn't the preferred method to check SWR, I would recommend that you simply stick with AM or FM mode to produce the carrier to get your calibrated reference, and your SWR - it's pretty much going to be the same on SSB unless you are driving something really hard with RF while using SSB.

I hope this answers the question you asked about why you don't see "right" or any SWR readings while using SSB unless you modulate some audio to get a reading.

On Thu, 19 Oct 2000 18:17:06 -0700, while the modem was pondering it's navel, "Maveric" <maveric169@hotmail.com> dissertated the following:

>How does SWR work on SSB. My SWR meter doesn't show a reading on SSB. The
>reason that I am asking is that I have a pretty high SWR on AM for CH 38.
>And I don't want to damage my radio on SSB.
>
>Thanks for you help,

Source record: 56218

There is a simple internal mod for the Grant XL/148 that will give a set of 40ch between 28.245 - 28-645 in the book "CB Modification secrets. It requires no crystals, boards or additional parts (other than an SPST switch), & does not remove the regular 40 or other expanded freqs that may have been done to the radio. It's easy & IT WORKS! The book is available from CRB, Advanced Specialties in NJ, & many other mail order companies for about $25-30 this mod also allows "upper freqs" in a Washington/142 without changing the XTAL........

Hams never set or calibrate for SWR in SSB mode. Typically we choose CW and transmit a steady tone with it to calibrate and read SWR.

Fact is nothing sounds better on AM than plate modulated tubes. Anything solid state is just half assed.

The 77 is my favorite of the Galaxy line. I prefer the elongated meter as opposed to the square-type on it's big brothers. (Although, I never had the opportunity to try the DX base series yet) That's a decent price for a decent radio. I have one as well, and as you say, AUDIO, AUDIO, AUDIO.

If you have modelled the antenna, then you have already determined the diameter and metalurgy of the structure, the length, and if you are using some sort of coil where it is located, the diameter, wire thickness, and length. Since you are asking questions such as the diameter of the steel rod, then I gather you really haven't modelled anything at all. How about a detailed description of what you have in mind, and then we can comment about whether or not it is a good design. Please don't ask us to comment about a design which none of us have seen. What software were you using to do the modelling??

This has got to be one of the worst books on antennas ever published. Hard to belive Orr published something like this after reading his Radio Handbook. I like to think he tried to water it down for people with no technical background and went way to far.

Hello Maverick:

Maveric wrote:
>
> I have made a model of a vertical 5/8 wave antenna I want to make, as I
> don't have the ability to put up a quad antenna. I have 3 questions. 1)
> What type or how thick of a steel rod should I use for the antenna and > the coil.

The vertical and horizontal element should be made from aluminum tubing,
to allow the antenna to be light, and resilient. But I have seen
antennas that are made from EMT electrical conduit tubing, three will be
a lot heavier. But will work the same, but because of the weight will be
more of a problem to get up high on a mast.

The coil, or impedance matching coil is where they separate the men from
the boys. Suggest you copy one from a CB 5/8 ground plane antenna to
save years of time.

Look at the ARRL Antenna Handbook, chapter 20 for antenna materials.
Available http://www.arrl.org Look up the antenna books from their
search option.

> 2) How would I go about attaching the Coax to this antenna.

What you need to do is have a look at few of the CB and Ham antennas to
see how they do it.

> and 3) What do any of you think about it? Will this antenna work?

A lot of home brew antennas are made and work great!. But what they
won't tell you, is a lot of home made antennas end up in the trash can
or the driveway to be run over by angry CB'ers and Hams who can't get
them matched in or the SWR adjusted correctly. This is what I call the
antenna "Twilight Zone" where everything you do makes the antenna
worser'er. At this point its best to inside sit down and forget it for a
few days. And before giving anther go, get a game plan together and
attack it again. Remember discharging firearms in the City limits is
illegal.

Also look at the MaCo V5/8 at:
http://www.majestic-comm.com/maco/support/index.htm

Before building your antenna, suggest you look around at what's all
ready up and running, and look thru the books, and get a game plane
first. Also if you pick up a used or older CB 5/8 ground plane antenna,
you can experiment on it without a lot of cost. Use a MFJ model 259B
antenna analyser for testing the antennas.

Here in Texas, papering the front yard is viewed as vandalism, and if it occurs after dark, the person/ people can be dealt with by the home owner. Perhaps those of us in Texas don't appreciate toilet paper as much as some of you up north do, but down here, it is vandalism. Once again, it stopped when I explained to the kids, and their parents, that such activity on my property would have the potential affect of death. By the way, in this state, it is much better to kill than to wound. Paperwork gets monumental if you just wound them, and then there is the question of who will pay for the ambulance to cart the scumbag to the hospital to remove the buckshot. If you nail someone in your back yard or in the bushes of your front yard, their ass is your's for whatever you want to do to it.

This is true. I was thinking more of the 'modulation' modifications - and perhaps others. It is also true that the final will be able to stand considerably more power - to a point. Also, I will be the first to admit that one popular mod is to allow the 'rit' control to work in transmit (the slide modification). I do NOT think, however, that a bunch of easy mods will allow one of the $89.95 Radio Shack units to perform like a $300.00 export model. Also, some of the mods may well end up making the radio sound like junk (with the wide signal, etc). The whole thread started when someone wanted to 'modify' a radio. The tech who posted was absolutely right. I've wanted to get back on HF and almost ALMOST bought one of the 10 meter RS units - until I started thinking again. I'll end up with a low power 10 meter only radio. I would like to get a decent unit, therefore I shall wait - and expect to spend well over $1000.00 to get it. Oh well ...

Paul,

Forget about "changing parts" in the noise blanking circuit.
Instead, find the test point on the board and adjust one or both
cans (depending on the chassis) in the circuit for maximum blanking
voltage before altering the design. You will need an rf signal
generator and a vtvm/vom to make the necessary adjustments. There
are 2 cans in the 3900 which control this function. Most shops
are for the most part unaware of this procedure. Should be part
of the receiver front-end alignment. Ultimately, whether you
change the rectifiers or not, this procedure must be performed
if you want the nb circuit to perform optimally.

Don't know where you got the 33% and 66% numbers.I have a couple 811A amps and DC input power is alway equal to RF out. This means they are running at 50%. Yes I push mine a bit beyound this too until I hear the distortion then back off and I know I am running at better than 50% when I do it. I also know the amp is not being run linearly anymore. A class B 811a amp runs about 50% efficent as long as it is with in its operating parameters no watter what the

drive. So does every other B class tube amp I know of.. If you actually do get efficiency higher than 50% you are pushing the tubes beyond their linear region of operation. You can do this and get away with it but dont say this makes a linear amp 66% efficient, it is not operating linearly when you do this. It is also wrong to measure amp efficiency with a modulated signal. Should alway be CW. If you can understand what you are doing by using your own methods,fine, but expect the rest of the world to tell you that you wrong and don't complain when they do.

Bottom line: If the efficiency of an amp changes with drive level then it is not linear.

I think he ment a physical scale model. From his pictures he has some real problems.

A 5/8th antenna has a radiator that is approximatly 5/8ths of a wavelength long and then is base loaded to 3/4 wavelength to make it resonant. The loading device is the physically weak point in the structure and typically this part is mounted below the attachment point so no physical load is placed on it. I would get rid of the coil and use a stub hanging below the radials for matching.This is probably going to mean doing a little research into some books so you will know what the hell I am talking about.

See you at the library.

2427. Re: Antenna Directional????

It is not the cophased array that is making your signal directional, it is the wierd ground plane that your truck gives. Getting rid of the co-phased array may well make the problem worse. The purpose of a cophased array on a truck was intended to fix the very problem you have discribed. It was not designed to give a higher gain directional signal as many believe. If you go to one anteena chances are you will stilll have directional problems but they will be different from the ones you have now, maybe you can live with them better.

2428. Re: 2100b amp question

Newsgroup: rec.radio.cb
Date: 2000-10-21 00:00:00 UTC
From: fire228@my-deja.com
Message-ID: <8ssjeodut1@nnrp1.deja.com>
Source record: 56237

cat,

You listen to these guys and you'll end up "cooking"
that 2100. For SSB operation, maximum transmission time
should be held to 50% duty cycle ICAS. Since there is no
output on ssb unless the transmitter is modulated. (unless
you use an amplified mic and it's picking up high levels
of background noise, heard often from "lid" operators) your
question is rhetorical and warrants no response. (stupid question)

AM Operation

One of the most misunderstood and mistuned modes available on the FT-101
transceivers is the AM (Amplitude Modulation)
transmitter. (Second only to the RF Speech Processor!) The FT-101 has
one of the best on-air signals for AM that you may
ever find in a stock radio. It is also one of the easiest to make a
mistake. The most common mistake is measuring AM power
the same way that you measure SSB or CW signals using a watt meter. AM
is very different.

The most common mistake is running too much carrier power in AM mode.
The FT-101 can only deliver 30-40 watts of AM
carrier in linear service. The reason for this is that an AM signal
contains a steady carrier and two sidebands that contain your
audio. The amount of RF power in this modulated AM "envelope" is
actually 4-times the carrier. This means that a modulated
AM signal with a 30-watt carrier is actually transmitting 120 watts of
power. This is the amount of power needed from the
power supply to transmit this signal. It is also approaching its
absolute power limit. The same is true with the matching
FL-2100B amplifier. A 300-watt carrier contains 1200 watts of RF power
when fully modulated. There is nothing worse than
"cooking" a FT-101 by running AM with a 100 watt carrier. The power
supply, tubes, and amplifier components cannot deliver
400 watts of power, are run continuously beyond their maximum rating,
and for long periods of time. Beware when purchasing
one of these 11 meter 'cooked' radios! I recommend that you secure a
copy of the 2100 operating manual and read it thoroughly, unless you
have a lot of money laying around. Power supply components for the 2100
are increasingly more difficult to find, besides the fact that 572 tubes
are a little on the expensive side as well. Loose the "gotta make it do
all it can" mentality and run this stuff within its prescribed limits.

You'll pay for it if you don't....
And if not you, then the next poor slob you end up selling it to will!

Doc,

Good answer, as long as prescribed drive levels are not exceeded.

Also....
Example:

50 % Duty Cycle = 2 minutes on, 2 minutes off.
BTW, Duty Cycle is determined by power supply and tube type.

The Duty Cycle can be extended by decreasing power output levels.

Subj: Three Friends

Three friends die in a car crash, and they find themselves at an orientation to enter heaven. They are all asked, "When you are in your casket and friends and family are mourning upon you, what would you like to hear them say about you?"

The first guy says, "I would like to hear them say that I was a great doctor of my time, and a great family man."

The second guy says, "I would like to hear that I was a wonderful husband and school teacher who made a huge difference in our children of tomorrow."

The last guy replies, "I would like to hear them say.....
LOOK!!! HE'S MOVING!!!!!"

A year or two ago I replaced my 99 whip section with a longer whip. I used a longer whip to make it tune better on CB. Before I could only get a 1:1 match in the freeband area.Now I can get !:1 on channel 20. At best I cant see the firstik helping anymore than this.

CHOOSE WORDS CAREFULLY

Every married man knows that there are days in the month when all a man has to do is open his mouth and he takes his life in his hands. This is a handy guide that should be in the wallet of every husband, boyfriend or significant other.

DANGEROUS: What's for dinner?
SAFER: Can I help you with dinner?
SAFEST: Where would you like to go for dinner?

DANGEROUS: Are you wearing THAT?
SAFER: Gee, you look good in brown.
SAFEST: Wow! Look at you!

DANGEROUS: What are you so worked up about?
SAFER: Could we be overreacting?
SAFEST: Here's one thousand dollars.

DANGEROUS: Should you be eating that?
SAFER: You know, there are a lot of apples left.
SAFEST: Can I get you a glass of wine with that?

DANGEROUS: What did you DO all day?
SAFER: I hope you didn't overdo today.
SAFEST: I've always loved you in that robe.

The only ones I know that will do that cost a lot of bucks. I had a military model and now have a Hikock but most tube testers just do emissions and shorts. This is really prefered in most cases because it is all you need making the tester less complicated and easier to use.

> >
>
> makes nonsense. If the efficiency changes with level then the amp is not
> linear.

That was my initial reaction(t'was I who said it makes sense superficially) but I am not so sure at the moment. His basic point is that an amp running 400 watts dead carrier -- 1200 volts @ 333ma so 3600 ohms plate resistance -- and one running under a 100% modulated single tone -- 1200 volts @ 500 ma 2400 ohms -- cannot be optimum tuned for both. You have to adjust the transformer or pi section or whatever to 48:1 or 72:1(or the square roots thereof) it cannot be both. It is more sensible to adjust under modulation. Ok.

Assuming that a mismatch of 1.5:1 does exist and does reduce efficiency by the same amount, big deal. If you can get 60% at peak, it makes no difference whatsoever because you get 240 watts of heat at every operational level. I would not personally operate that close to the 260 plate dissipation available but that is not the issue.

You are indeed correct; this would introduce some level of non linearity. It would be about 1db and well within acceptable limits. Measured from the usual place on the plate output you might not even see it on the scope.

I have kind of come to the conclusion that the effect is real and of major interest if one is running some form of a Kluge Model Q amp and not a huge big deal otherwise. Assuming, of course, that one tunes for max efficiency at max output. In no way can I see #12's Rules of Thumb being justified by the available data unless it is assumed that the tank is at the end of its adjustment range because it is way off of design-center frequency; then they make sense big time. He correctly notes that running 11 meters from a 10 meter coil tap does not have sufficient inductance to work correctly in its impedance transformation role although it might resonate.

To be honest, I can't get that wired up about Antique Modulation linears. Even less about the latest 'swing kit' variation on Taylor Modulation from the 40's.

Nothing personal with Lou... but those speech processors are awful. They work literally on the principal of distortion. While I agree that this method does boost the average speech level... it's a horrible price to pay with that tremendous distortion level.

What you really need is an Analog Devices based system. You can read up on it at
http://products.analog.com/products/info.asp?product=SSM2166

I have built several processors with this chip and it works like a million bucks...

No, I'm not an ass. I have however had to get out early in the morning on a number of occasions and clean my yard up before going to work. I would describe anyone who trashes someone's yard or knowingly permits their offspring to do this is however a genuine ass of the first magnitude. On one occasion, some girls used shoe polish on the brick and it took a professional service and a couple hundred dollars to get the shit cleaned up. You obviously have no children of teen age, or if you do, you haven't had the pleasure of being on the receiving end of this sort of stuff. I see no difference in someone painting "Go Team" on a wall and someone who paints "Drop Dead". The result is the same--it has to be cleaned up, and it takes time and frequently money. I have neither to spare for this sort of crap.

Tnom, what is your view of vandalism? Perhaps you can educate me and change my attitude. I doubt it, but give it a shot. In the mean time, in my neighborhood, nobody is ever to found lurking around bedroom windows in the middle of the night, and that doesn't bother me in the least.

This is the first I heard of that explanation for co-phasing. Are you saying co-phased antennas were designed to reduce problems like his due to undesirable symptoms produced by a singular antenna being utilized on a big rig? Was the bidirectional result an unintentional byproduct of this technique?

I guess you have had to be around long enough. Phasing two antennas does not make it that bi-directional. You get a couple of sharp nulls in the line going thru both antennas and that is about it for directionality. usually if you want a bi-directonal array you put them a 1/2 wavelength apart.

I ran into some trolling pieces of filth on AM today i think i was on ch13 or 14. what a bunch of lip. If i ever hear these guys again... well i'll have to buy a plane ticket and some sewing needles... what a bunch of asses...

Anyhow its people like this that make people think that SSB separates the professors from the gilligans... if ya know what i'm diggin' at.

I've had a ton of fun on AM in my past and till this day... but why so much crap.

I know it's just a hobby and a guy can turn the radio off at anytime... but why I'll just go north a few clicks and go ssb.

Thank god it was skip, but i feel for the people who locals to those tards.

73's and i rest on your final,
Nw000

AM is great...
It's like a good looking piece of real estate in a crappy town.

BTW, i couldnt get a 20 out of these "tards" that i mentioned...
aarrggghh

..which can be achieved by co-phasing antennas on a big rig with the proper spacing distance between the two, correct? What are the purpose of co-phased antennas on big rigs if not for directional benefits?

2456. Re: Icom... does 11-meters!

Tim,

I'mm not sure I understand what you mean by "not as good as they could be". I mean, what else can I ask for. These HF rigs ARE clear, run true AM and I am quite well understood by those I QSO with. What else can I ask for? This is not meant as a criticism, but are you talking about the overmodulated "swing" stuff? IF one is being heard Q5, what else needs be done? Please clarify. I am VERY satisfied with my Icoms and the Kenwood TS50. They are all mode, all band HF radios that are quite clean no matter what mode is used. Can you give me something to go on as to what they "need" to sound better?

James,

That incident reminds me of something that happened to me in '69. In those days, I had a moderately powered mobile transmitter in my car. The HV was provided by a 600 volt 150 mil. dynamotor. The antenna was a Master Mobile brand HF antenna, a center loaded whip. I was young then and, like the other kids, I liked to cruise the streets and drive-in joints. Needless to say, that antenna attracted attention--some of it unwanted. One night, I drove into one of the local watering holes for a bite to eat. Since the whip was so tall, I had to pull into one of the slots at the back of the shed. It had just come one of those summer thunder showers and the streets were exuding steam. The humidity was worse than before the T-storm. Behind the drive-in was a shopping center in which a group of bikers liked to sit and whistle, catcall, and make lewd remarks to the girls as they cruised thru. When I drove in in my '67 Chevy, whip waving around, they began to make fun and jeer. One of them said, "Look at that s.o.b. with that 'reddy-o' antenner--thanks he's the po-lice. Ah thank Ah'll jest go down there and break it off and dare 'im to do anythang 'bout it". With my window down, I heard the hippie's remark, and thought, "Hmmm, I don't know about that". I reached down and turned on the transmitter filaments. I watched out the rear view as he tried to "sneak" down to my car. Remember, it was VERY wet and the humidity was high. Had he grabbed the whip hard, it would have just gotten hot, he would've turned loose, and that would've ended it. BUT he very gingerly reached up to grab the antenna, and by then, the dynamotor was up to full output. As he eased his fingers around the whip, I saw a tiny blue arc from the whip to his fingers just as he closed them over the antenna. He yelped, no, screamed, jumped back, and let forth a stream of obscenities. Shaking his hand and blowing on it as if to put out the "fire", he ran back to his motorcycle and told his buddies, "Don't F*** with that car, it's electri-FIED!". You know, I never had anyone else ever try to mess with my vehicle! While I snickered in my sleeve, he never suspected that I did it on purpose.

James,

If you are careful you just might get a fine HF rig for less than
$1000. Last summer, I bought a new IC706MKIIG for $979 out the door.
I added a certain filter which ran the price up, but the rig was less
than a grand without the extra stability option. I think the remain-
ing TS50s can be had for less than that, but you don't get VHF/UHF and
the built-in DSP unit. It's just what fits your needs is the thing to
get. What I love the most is the fact that I now have only ONE radio
in the car, ONE control head (remote), and two antennas instead of a
"farm".

2459. Anyone Ever seen A shattered Antron 99 ?

Newsgroup: rec.radio.cb
Date: 2000-10-21 00:00:00 UTC
From: Tinker <Speed_Buggy@hotmail.com>
Message-ID: <8sthm0$d1k$1@ins21.netins.net>
Source record: 56368

Well, I did tonight. My brotherinlaw and I were trying to put up his 99 and a 30 ft. tower. Well, he almost had it walked up and stood up, then everything went downhill from there literally. The top got to heavy and it tipped over into the ground guess what happened ? Exactly, the a99 looks like a broken corn stalk.
So , my next question is, how does everyone put up their towers ? With a crane or more than 2 guys ?
Well, I think I need a beer after this night !
see ya all at the bar !

From: Tinker <Speed_Buggy@hotmail.com>
Message-ID: <8sthso$14q$1@ins21.netins.net>
Source record: 56369

Before I go to the bar, I have a question. My brother in Law and I have two old radios that we need to dust the cobwebs off of, and we want to get off the busy channels and do some freebanding. I know there is a way to swap crystals with the transmit and the receive but does anyone know this procedure and have a chart as to what freq. we would be on ?
I would like to tune into that freq. on my mobile (2950) to talk also.

Thanks again,
Tinker

2461. Smaller Base Antenna.

I have no other place to put an antenna but in a tree, however, I can't seem to get my old A-99 up there and have it stay. It is also too big for my application and I am looking for something about 8 feet or so. Anything that is smaller than the A-99 and will work. However, I have used those little tiny 3 footer so no need mentioning those. Any ideas? Thanks!

Stick a 102" steel or fiberglass whip, (hell a piece of wire would work).
Up in that tree get it about a half to a full wave-length or better off the
ground.
See if you can rig about 3 or 4 102" or better wires from the base of the mount
on to
some branches or poles. Try not to have a slope of anymore than 45 degrees to
the
ground on the downwards for the ground radials.

I did this and worked alot of cards and could prop around 40 to 60 miles local
on 12 watts.

I didnt use a tree though. I used a flag pole at 33 and a1/3 feet to the base of
the mount.

All true, except there are only 3 6146's for finals. Two for modulators.
Five total. I used one as a novice for cw. Also the ranger a good one.
It's like a "mini valiant". The weak part about the valiant in the
modern world is the lack of ssb. It was an add on, and you used the
valiant as a linear. The valiant was a pretty neat rig for it's time.
55-56 era..Really wild looking at night with it's glowing blue 866's. It
was my first "big" transmitter after my first single tube homebrew job.
used it with a HQ-110 receiver. MK

Tinker,

I am sorry to hear about your brother-in-law's misfortune. The best way to erect a tower is with what is called a "gin pole". It is a device that attaches to the legs of the tower, has a pulley at the top, and is used to hoist each succeeding tower section into place with rope. As each section is set and bolted, the "gin pole" is removed and bolted on-to the next section, the following section is set, and so on. Then the device can be used to hoist the antenna safely into place without dan-ger of it getting away. Ask some tower erectors or local hams about these handy tools. Most would be glad to show you one. Once you see it you may find that you could make one quite easily.

Better luck with your next "tower party".

I have a question, I have a 1998 Freightliner FLD120 with a 70" condo sleeper and what my problem is is that I am super super directional! Wehn I am going one direction someone can hit me at about 9 s units and then I turn a corner and almost gone!!! I have a Uniden Grant XL and a 250hd amp and my swr is about 1.3 all the way around the band. I have 2 4' fiberglass antennas (I know, JUNK) and have tried facing them forwards, backward and every direction possible and still no luck. I would use taller antennas but that would put them above the top of my sleeper and I don't want to be driving around hitting every brige with them. Any ideas on how to get rid of some of my directional problem? Thanks in advance.

Tim,what is so different or specal about a ts-450's audio that any other kenwood does or doesnt have.. seems to me you just want to hear a loud overmodulated raspy sounding radio on AM i have a ts 850 hooked to a moonracker 6 with about 500 watts. As clear as it sounds and as many lips that i CUTOFF you may think i am transmitting from a broadcast studio with a 50,000 watt flame thrower... I don't try to overmodulate the radio or make it sound like something it is not ... Of course it doesnt sound like my ft101zd but it is a crisp clean sound that doesnt rip up all 40 channels .. i guess to each his own..

sorry bill you got the wrong guy. youll never hear a signal like that comming out of my radio. fact is you wont hear any AM comming from me but thats not the point. not sure whats special about the 450. havent had one here to look at but the ones i've heard did indeed sound better than other hf rigs on am. if these radios were so good or even decent on am i think there would be alot more of them in use on 80 and 160 meters but fact is they dont cut the mustard.

Source record: 56200

hillbilly <hillbilly001@my-deja.com> wrote:
: someone explain "skin effect" to him

Why? It has nothing to do with transmitted signals, unless the tubing happened to be paper thin.

There is a formula for calculating the depth at which rf signals flow in a conductor - based on the frequency of the signal. At CB frequencies, it is very shallow.

Message-ID: <8sr60c$1t7$4@bashir.peak.org>
Source record: 56203

Bill <wdecker1@rochester.rr.com> wrote:
: Maybe things have changed, but in '69 the fact that there was in my
: possession equipment capable of operating on frequencies for which I was not
: licensed, and with RF emission capabilities in excess of the limits for
: Class D, and that this equipment was in fact connected to a power source and
: a device capable of radiating transmissions made by said equipment (an
: antenna) was sufficient cause for the presumption of intent to operate in
: violation of Part 95. Penalties included fines and/or immediate seizure and
: forfeiture of said non-compliant equipment.

Funny. I had a ham transceiver hooked up to various antennas during that
time period - as I was working on learning the code by listening to the
on-air transmissions. I did not fear the FCC would confiscate my equipment.
The regulations did not prohibit such use - as long as I did not transmit.

: Again, this is subject to interpretation, but as a fine point of the law,
: possession of "bad things" in a ready to use status can and has been
: considered a violation in and of itself. If one also gets caught actually

I would like for you to cite just one case where equipment was confiscated
due to simple possession - and not illegal use.

: It's like the dope laws, if you have over a certain amount of the substance,
: it changes from "posession" to "Possession with intent to distribute". You
: don't have to sell anything to be termed a dealer. You don't have to
: transmit to be a "bootlegger". Again, rules are subject to interpretation.

Anti-drug laws are the most draconian around. And keep in mind that many
of them are state laws, not federal. The radio possession rules are mostly
regulations, not laws.

Again, cite just one case.

: What you need to remember is that we don't get to do the interpretation,
: "THEY" do!!!!!

For the drug laws, no interpretation is needed. The laws explicitly state
where the catagory boundaries are.

Scott,
No, you shouldn't have to ground a low-pass filter. For a
good low-pass filter rated for over 1KW, expect to over $75.
Used would be cheaper of course. If your going to run 1KW, you
need a filter reted for at least 1.5-2 KW to be safe.
'Doc

2502. Re: what is the deal with left coast radio?

Newsgroup: rec.radio.cb
Date: 2000-10-22 00:00:00 UTC
From: MN-53@webtv.net
Message-ID: <26919-39F37882-40@storefull-112.iap.bryant.webtv.net>
Source record: 56410

Hillbilly, I have nothing against you, so let me state this again. I originally bought a Texas Star DX 500 HDV from Coax. I had it awhile and in the mean time I bought a new truck. It was going to be to hard to make it fit in the new vehicle so I call Coax up to see if I could trade it in for a 100 Watt radio. He said yes he had one a TR-6900 that he would trade for the amp. All was fine till I got the radio. The radio would not work right on any antenna system and I tried many. It just went wild (very unstable). Ok, no big problem, I'll just call Coax up and I'm sure he will make it right. This is where the trouble started. I called, and called. I left messages, I sent a fax and no response at all. So here we are with the news group. This works the best. It gets right to the point. Do you think he hears me now? You bet he does! The question is will he make it right or not?

2504. Palomar linear troubles

Newsgroup: rec.radio.cb
Date: 2000-10-22 00:00:00 UTC
From: Larry Moskal <larry@sgi.net>
Message-ID: <39F3ACE5.E4CC22@sgi.net>
Source record: 56412

I was operating my linear yesterday on 26.290 mHz when it was last tuned at 27.805 mHz. It was fine for about 20 minutes then the finals got hot. I could smell them and the side of the linear got very hot. It blew a fuse in the house electric box. I checked the tubes last night. It has two driving four. They are 6LF6's. All six. One driver tested 15%, the other 90%. Two finals were like new, but one of the others showed a short and the fourth was very low but wasn't shorted. Should I expect anything else was affected or not. Does anyone have some of these tubes for sale or know where I can get them reasonably priced? I believe now that this operates in low power with one driver and two finals and high power with both drivers and all four finals. Is this correct? If so, I could change the bad with the good, and still operate on low while I wait for the tubes. I was operating in low power when this happened. I know this is very long but I couldn't figure out how to get my point accross in any less words. Any information would be appreciated. I just got this linear fairly recently. I'm used to solid state mobile linears.
Thank you very much for anything you can offer.

2511. Re: Grant XL to 10M?

Newsgroup: rec.radio.cb
Date: 2000-10-22 00:00:00 UTC
From: Bill Nadzam <nadzam@bills2way.com>
Message-ID: <39F3B711.2FD13D72@bills2way.com>
Source record: 56419

The loop crystal can be changed. It should be an 11.3258 Mhz crystal right out of the box. This feeds a Tripler stage.
So...
since channel 1 is 26.965 Mhz, and you wish to change to 28.3 MHz.

Differnce is 28.3 - 26.965 = 1.335MHz.
1.335 Mhz / 3 (For tripler) = .445 Mhz
SO.. 11.3258 + .445 = 11.7708 Mhz.

Your looking for an 11.77 MHz, or there abouts crystal.

Also keep in mind you can also change the PLL divider lines with the crystal that is in there and get up to 28.035 (I think, its late and I have had a hell month.)? Mhz on Channel 40. So you could just call up a parts surplus center and look for something in between thesee two frequencies.

Paul Knight wrote:

I agree with Hillbilly Dave on this one.
The DX-66V is one of the best for drivers. Why, It has what they want.
Echo, Good sounding receiver, Freq Counter, and yes the extra channels they
just can't live without. Variable power, Big Meter, and on..

I often talk drivers into the DX66V over their first want, the 99V. 98% of
the drivers will never ever use SSB, and those Voice charger/Robot functions
do not work anyway. So why spend the extra $ for something you will never use?

When Jacques Cousteau was alive and on one of his deep sea explorations, he discovered a rare tuna fish that lived at great depths.

Upon further examination, it was discovered that the tuna's vagina smelled exactly like a human finger!

I've been in contact with Jacques Cousteau's engineering department for the past 30 days about the possibility of an upgrade for the human finger! They agree your an idiot and also thought your weight was an issue. Buy the way this end user has two degrees, one in electronics and another in computer science. The next time you want to BS your way around something, instead of asking mommies help, why don't you try it? You might even learn something!

.....I'm just trying to help by telling the truth & they can't handle it!

It sounds like they may both be telling you the same thing,
just measuring power with different type meters. The first
place could be using a 'peak' meter, the second an 'average'
meter.

I had a Viking II a few years ago loved it. Now I got a Valiant. It goes everywhere, it can stay keyed at least two hours at a time (Kids please don't try this at home!!!) and is a very consistent transmitter. I traded a Maco 8-element and bought a $7.00 audio driver tube for it and I've been happy ever since. If you can, get a valiant.

Hello Big Dog 326: Sure you can increase the performance of the antenna.

Add on 4 each 96 inch francis amazer fiberglass whip antennas as ground planes. You will probabaly half to retune antenna. I am having a bracket made for a guy to just this.

Jay in the Mojave

> ..which can be achieved by co-phasing antennas on a big rig with the
>proper spacing distance between the two, correct? What are the purpose
>of co-phased antennas on big rigs if not for directional benefits?

Co-phasing vertical antennas on a vehicle increases the bandwidth of the antennas. By having two antennas hooked up to the radio, they are tuned for different center frequencies, which allows for lower SWR's across the board. If you have them between 6 and 9 feet apart, and set the center frequency on each around 500 khz, you will get a band width of about 1.2 mhz, as opposed to the usual 500 khz or so. This is especially important for those people operating on the "freebands".

Co-phased antennas when placed horizontally on a base, like co-phased yagis, increases gain in one direction.

Hope this helps!

True, but you get the greater bandwidth at the expense of symmetry.
Without symmetry you'll get a directional effect. Usually co-phased
arrays are intentionally arranged to be as identical as possible to
create a symmetrical radiation pattern.

I think you could also just change the PLL reference Xtal. I believe it is 10.24MHz, so changing this to 10.6MHz ought to cover it off nicely. I would highly recommend performing a slider modification, if you haven't already, to capture everything in-between channels. You will also have to perform some minor re-tuning of the VCO, Transmitter and Receiver to optimize things.

IMO, a transformer-modulated output stage sounds the best on AM. The
IC746 does not incorporate this type of design but makes use of DSB
generation and carrier re-insertion. Why? Cuz it's an SSB radio first
and besides, its cheaper that way. :) Many CB radios do it this way too
to cut costs. Output transformers are probably the most expensive
component in the radio so if you can get away without one you reduce
build-cost and increase profits.

Thanks, Andy! Yea, it sheds some light on it. I've co-phased at the base QTH before, with not much of a noticeable difference, in other words, the hassle vs. the benefit was not worth it. Never co-phased on a vehicle, but many of these good 'ol boys here swear by the co-phased systems on their big trucks, rigs and mudders alike for directional improvement, and many of the rigs they run, Cobra, Galaxy, etc., are mainly on the AM 11 meter cb freqs. So a co-phased setup on a vehicle is primarily NOT for directional improvement, but for better band width selectivity, which may or may not improve direction, right?

==========
Gee Pat, you bought an amp from someone else and weren't happy with it so you sent it to us. We reworked the input network and brought the swr down from 3:1 to nearly flat, rebiased the amp for better SSB operation, added neg. feedback for stability and increased power output by 50%, and only charged you $65
You still weren't happy with this amp so we gave you more than you probably paid for it in trade in on a Texas Star amp.
7 months later you returned the Texas Star amp with a blown preamp and we repaired it at no charge, even though it was out of warranty.
Still not happy....
2 months later we gave you a killer deal on trading in this amp towards a radio. I had our tech go through the radio 3 times to be positive that it was in perfect condition and performing above factory specs.
2 months later, while we are in the middle of the BIG MOVE you return the radio without getting a return authorization and sent it to the old PO Box, 400 miles away from us. You should have contacted me first, I would have had you send it direct to our tech or to RCI for warranty repair, if needed, or worked out a refund for you.
We bent over backwards to get you equipment that you'd be happy with, like we try to do for all our customers, and even went further with you as a professional courtesy since you are in the business as well.

I guess it's true though, YOU CAN'T PLEASE ALL THE PEOPLE ALL THE TIME, no matter how hard you try.

You have my email address, give us a little time to get back up to speed and we'll do what we can to straighten this out.

From: Joe <joeamp@mindspring.com>
Message-ID: <8svg3dpko1@slb0.atl.mindspring.net>
Source record: 56493

I just picked up a nice old but clean Panasonic RJ-3200 23 channel mobile,
beautiful set.
Sound like a dead rf amp or mixer, need schematic.
I have a Sams CB-20 with the Comstat 25 to copy / trade as well as some
Heathkit

well i'll tell ya like this i bet have of you so called radio techs and
wanna-bee techs have tune-up manuals laying around tripping over them. i
clipped my radio and i tell ya it splatters so good i got people from
other channels coming up there to tell me i'm blowing smoke. a limiter
ain't nothin but a restrictor plate for a radio, that the fcc requires.
just like nascar does the race cars . i might be wrong but i say remove
them restrictor plates and let'm run "WFO".

What are the best methods to suppress alternator noise that disappears when removing antenna from it's mount. Vehicle is an 1993 GM car with a CS-120 amp alt. Please be specific on the what, where and whys. If components are used please state the value of the needed components.

I want to buy a new amp, but I want to make sure I get the right one. I bought a Galaxy 225, and the people from the shop told me it was putting out anywhere between 215 and 220, but when I took it to another cb shop by coincidence, they measured and told me that it only does about 145 or so. Why is that? As far as I understand, the 1446 chip, can only generate about 80 watts. Is that right? How about the amp picture I attached to this messege, is that configuration right, and, will it produce the ammount of watts it says on the web site it does? Anticipated thanks for your help.

I just purchased an Imax 2000 and have been in contact directly with
firestik for the past 30 days about the possibility of an upgrade for the
2000. Their engineering department said "NO" for multiple reasons after
testing and evaluating the Imax design. They saw no value in their
testing of adding a helical whip to the Imax design and saw a "DECREASE"
in performance! Added weight was also an issue. This is right from the
horses mouth. Engineers know better than subjective end users. They do
see value in the addition of a fireup 99 to the Antron 99.

Getting back to the original point, by both state statute and case law, in all cases, if a homeowner/renter finds that an intruder has entered his property for the purpose of threatening either bodily harm or harm to property, and if it is dark at the time (night), the resident can use whatever force he deems appropriate to protect himself, his family, or his property. (Property rights are a big deal in Texas. You can still be executed for cattle theft.) In other words, if my car is parked in the back driveway and the alarm goes off, I will go out to check it, and I find a pair of legs sticking out from under the engine, I have the option of doing nothing, helping him to steal parts off my car, call the police to arrest him, or kill him on the spot, eliminating the need for one of those costly trials. It's the law in Texas. The police come out, drag the body away, file a report, the grand jury issues no bill, and the neighborhood has one less crook. It seems to work here because it doesn't happen very often.

Thank you all for the reply. I thought I would reply to all with this one message to save bandwith and my keyboard. I cant say how many legs it has because the tech I took it to is the only one who saw it and told me about it. and he took it out and thrown it away . It is a final transistor which I thought is also known as a RF transistor. The radio I need it for is an old 23 channel handheld. Its a Lafayette Dyna-Com 23 I asked my tech if he could use a different one in place and he said no. He said it was a little metal canister with only a marking of F8 on it. Hope this info helps.

Thanks

I have the DX73v and like it very much. I made one mistake because its my first export radio and that is it does not have sideband. All the trafic I here on the extra channels are mostly side band or portaricans maybe. Not sure about the 66v but I would recomend getting one with side band. Only if I knew what I know now. But thats life.

MLR,
I don't think the mic is the problem. You might try
reducing the carrier, till you get 'forward swing'. It
will mean lower output, but too much carrier doesn't
help anyway.

Darcy,
Start by moving the ground (-) to the battery. then you can
find out if the 'whine' is coming in through the power lead, or
the antenna. Do that by removing the antenna from the radio.
Do you still hear the whine? If so, the it's coming in through
the power lead. Filtering the power lead will get rid of the
noise.
If the whine dissapears, or is reduced by removing the antenna
from the radio, then it's coming in through the antenna. This isn't
as easy to get rid of as the other. Shielding is where you start.
You do this by grounding the hood, fenders, etc, to the frame.
You'll know when you've got enough grounding 'cuz the whine goes
away.
You didn't say what year your car was, the newer ones have a
problem with a whine from the fuel pump. By-pass the fuel pump
power lead as close to the pump as possible(in the fuel tank is
best).
This ought to get you started. A five gallon bucket of torroids
comes in handy...

There have been a couple of radios that were sideband only. No AM, FM or CW. To check SWR on a radio like this you would inject a constant tone in to the audio input and key up and measure the forward power then measure the reverse. The output of the radio will essentially be a CW signal.

Check out just about any edition of the ARRL hanbook. They handle filter constuction faily well. For just a little money you should be able to build a filter that not only cleans up your signal but optimizes the impedance match of amp to antenna.

I cant think of any where they use carrier reinsertion. All the ones I am
familar with unbalance the balanced modulator to get a carrier. I think the
low level modulator is a heck of a lot better than those "bootstrap" modulators
they use in so many AM only CBs.

A cophased system can provided some gain and directivity. This is what they were origonally designed for as a base installation where you can get proper spacing and a good ground plane for the antenna. On a mobile where spacing usually comes up short and radiatioon pattern has already been screwed up beyound all recongnition co phasing can help even out the radiation pattern. First you have to realize that if a simi has 1 antenna on 1 mirror the signal will go for the most part across the cab in the direction of the side without the antenna. In other words, towards the best ground plan area. Co phasing two FUBAR patterns like this does not result in your text book example of two in phase antennas a 1/4 wavelength apart. Yes it does tend to push the signal in a direction inline with the truck. However since the signal with one antenna tends to go across the truck the result of cophasing in this case is a more omnidirectional signal.

Orr didn't start with that book though. His first book was well written and accurate. His CB books are junk. His books written after that are also good.Mr. Orr is a well respected engineer and I doubt if he "gleaned" his information from anyone. I think the poor quality and misleading info in his CB books are more of a result from pressure from his publishers to write a non technical book written on a 6th grade level.

Alternator whine can be cured completely by going over to Radio Shack and buying the cylendrical filter they sell for about $15 for that purpose. It has about 30dB of attenuation at the frequency of interest!

The horror stories are probably just that stories. Canada customs could
care less about radios. They will ask you if you are bring anything into to
the country that you are not bring back. Be sure you have the proper
fishing licences or you will loose your car, boat and any other gear, if
you are caught.

Enjoy the fishing and welcome.

Greetings!

And this is what makes CB'ing fun...

No high-tech language, simple basics, light conversation with brief blips about animal life, truckers, lot-lizzards and the open road. ;-)

It's written for mainstream America - back then.

Today, words like conjugate, propagation, skin resistance, Q-factor, Impedance - all necessary, but as part of the evolution of CB'er to a higher level of understanding. The book was not intended to inundate the the casual user with complex information. It says so in the beginning chapters.

It also constantly warns the reader about myths and how they have come about. Thats where the "gleaning" phrase is my interpetation. Bring out the working mechanisms and discuss why the "myth" is there for the observer, the investigator [Orr and Cowan] dispels the myth by disclosing these hidden mechanisms that make the myths seem so true for so many.

I found the book to be quite concise in it's efforts to raise the level of comprehension to those that need to understand the basics.

My appologies to see that you feel Orr and Cowan have failed.

They haven't - but maybe the interpetation you feel they should have presented it, is too harsh of judgement to pass to others that have learned the same hard lessons the book dispells.

I will have to admit - they have keept the book in print for years and it's still selling today because of the straightforward approach to the end-user. It's a very effective book for what it is.

On 23 Oct 2000 10:39:52 GMT, while the modem was pondering it's navel, hamm4fun@aol.com (Hamm4fun) dissertated the following:

Greetings!

The VCO and PLL work with a diode that when voltage is applied to reverse bias it - it exhibits varying capacitance that is voltage dependent. Changing a value in a tuned circuit like the VCO, either thru inductance or capacitance - or both, change the frequncy response of the circuit. The PLL sends a voltage to the diode that affects capacitance in the tuned circuit, changing its' frequency.

The diode is called a Varactor, and a typical CB varactor diode doesn't provide a lot of capacitance change - the super swinger diode does.

Try contacting Copper electronics or Bills 2 way - both are out here on the 'net. Or for a direct source, contact RF Parts.

I don't think they are referring to the amp's output, Michael, just the price. Just remember, an item is worth what the market commands, or whatever an individual is willing to pay. If the consumer is happy with the purchase, that is all that matters. I think they are saying you might have been able to do better on the original price.

Greetings!

I can give you some hints, but you're going to have to get your hands dirty if you really want to tackle the problem yourself.

As you may already know, the CB radio is a great way to detect engine noise - and as a means to indicate when a tune up is needed. Nore noise = time to take another look at the engine or whole vehicle.

Since you have alternator whine, have you checked the battery connections to both the engine/starter and block/frame grounds?

You may have some corrosion there, and if the alternator is older, it may be giving you a signal that the diodes for either the regulator or the output post to charge the battery - may be failing. Or worse, the battery is weak.

Thats is why you may have to get your hands dirty, or take it in for a serivice check. With winter arriving soon, it's not a bad idea to have your vehicle checked.

If you decide to take it in, observe and ask to inspect the vehicle with them. They can't point out everything, but you would have a good indication using your own eyes, what the condition the electrical connections are in, under the vehicle.

I also have a test you can take to help you sort out these problems...

http://www.iserv.net/~codyspc/engine.htm

This "test" may help you with the above when is comes to having your vehicle winterized.

> in his truck, will he have problems crossing? Thanks.

I doubt you will have any problem with the CB or scanner as long as you are running barefoot. Boots are illegal and will get any radio equipment confiscated. No license is required for CB or scanners in Canada, but ham equipment operators are expected to have a license if they want to use the radio.

Also, radar/laser detectors are illegal in many provinces and can net a fine and loss of equipment. Here in Ontario our OPP have 'radar detector detectors' mounted in many of the cars and they'll just about strip your vehicle looking for your equipment if they suspect you are cheating... no warrent needed because you are in the process of breaking the law.

Make sure you have the proper fishing license and for dam sure obey the fishing regs or expect to lose everything and pay a hefty fine. (Last year two guys got a $3,500 fine each for trying to take home 103 walleye after a two day fishing trip.) Also, don't bring a handgun across the border, even if you have a CHL, or you'll be in for a very tough time. For that matter, if you have a long gun in the vehicle, be dam sure to declare it at the border and pay the fee required to register it because Canadian governments are irrational on the subject of guns. BTW, any paperwork done with regards to guns will be forwarded to the FBI and the BATF by the Canadians.

So, as long as you don't have a criminal record, carry drugs or guns or have boots on your radio, you should be fine. Welcome to Canada. BTW, be sure to have proof of US citizenship for when you try to get back into the States. I've heard of people getting stuck in the "no-mans-land" until someone can be found to vouch for them....

john wrote:

> Is the midland 75-830 the smallest handheld cb?
> I don't need full power (5watts) and would appreciate any leads on
> smaller, lower power cbs.

John, I'd suggest that you go with the Midland 75-822. I just bought one last week after researching all the handhelds commonly available. What I was looking for was a full power radio that I could use as both a handheld and a mobile without having to have a permanent mobile mount. While my personal car has a Uniden, any rental vehicle I have ever had has no radio and it's usually when I'm driving in a strange city that I need immediate directions on how to get unlost.

The 75-822 is actually the 75-820 with the adaptor included. The adaptor works really well, just plug it into the cigarette lighter, screw the antenna connector into the mag mount antenna, take the rubber duckie off the radio, slide the battery pack off and the adaptor on and start transmitting. (er, don't forget to put the mag mount antenna on top of the car...) About a 4 mile range with the cheap antenna I've got. (tested range by having son drive out of town while I sat at home on my Uniden PC68XL with a K40 ant.)

When using as a handheld with the rubber duckie, it gets a little less than one mile but it still sounds as good as any other radio I've had when I'm talking to the truckers. Only problem is that the rubber duckie won't work well when I'm sitting inside a vehicle.

And the difference in size between the '20 and '30 is rather small. Heck, my electric razor is almost as big as the 820. The 75-820 easily fits into a shirt pocket and with the battery pack off and the adaptor on it's just a little larger than a standard size mike.

Hope this helps.

Don

Jim,

You surely can find something at a reasonable price (for these days).
I almost went for an FT100, but somebody told me these rigs were still
having troubles. I decided to stick with what I "knew" were tried and
true. The TS50s and 706s have served me well with very little trouble.
I had one of the original 706s in the mobile for almost 4 years and it
gave FB service. I bought it new at a "hamfest" special price, also
less than a grand. I am also a member of Civil Air Patrol and I had to
have rigs that would meet NTIA/USAF standards, hence the additional fil-
ters. The older 706 has gone away to have this installed as well. The
only thing about the Icoms is that the components are SO tiny, I can't
get my big mitts in there to work on the darn things! I have done some
repairs on them, but, to me, it is a hairy process because I have large
hands and, as I get older, it gets harder to see those little chips and
such! LOL! I have to have a lighted magnifying glass. Adding the filter
to the TS50 was simple: remove a couple of boards and solder the filter
into a pre-traced spot on the PLL board (I think--I forgot which one it
was. I followed the schematic at the time).

Anyhow, I hope you find a rig that meets your needs and provides many
hours of fun.

2616. Re: what is the deal with left coast radio?

Newsgroup: rec.radio.cb
Date: 2000-10-23 00:00:00 UTC
From: MN-53@webtv.net
Message-ID: <1924-39F47A09-2@storefull-118.iap.bryant.webtv.net>
Source record: 56530

Yes, I did buy that Palomar 600 elsewhere. It sounded really bad on sideband, so i called you, and you said you had some mod for it that would help. But even after the mods, it didn't sound any better on sideband. Come to find out later there was nothing anybody could do to make that amp sound good on ssb.

Ok no big deal, So I asked if I could trade it in for A Texas Star 500 you said ok, no problem, I got the amp and it worked great, it was a good amp. I even called you up and left a message telling you that I was very happy with it. You are right, it was about seven months when I returned it with a bad transistor, you looked it over and found a solder blob under the board that shorted out. You fixed it, I did Ask you what I owed you for the repair, you said no charge!!

You are wrong! I was happy with your service and with the amp at that time. Yes I did call you up to see if I could trade it in for a 100 watt radio, I had bought a new truck and it was going to be to hard to get the amp in the new truck. So Whats the big deal with that?? You didn't have to make the deal. I tried to call you several time I even left messages and i sent a Fax. Thats the point here.. I don't know what more I could have done to get hold of you.

You have my number, give me a call collect, and we will settle this.

2617. Wanted: RAYTHEON CB GEAR AND HISTORICAL INFO (Apelco and SBE info too!)

Newsgroup: rec.radio.cb
Date: 2000-10-23 00:00:00 UTC
From: k5dh@raytheon.com
Message-ID: <FO%I5.26$W94.1140@dfw-service2.ext.raytheon.com>
Source record: 56531
Cross-posted to: rec.radio.cb,rec.radio.swap,rec.radio.amateur.boatanchors,rec.radio.amateur.equipment

Hello to all!

I am a collector and restorer of vintage Raytheon CB radios and walkie-talkies. In addition to building up a personal collection of equipment and literature, I am attempting to document the history of the Raytheon CB line, which spans the period from 1960 through about 1972. All of the info that I collect is being shared with the company archives, which, until I began feeding them information, contained NO record at all that Raytheon had ever been in the CB radio market at all!

What I'm looking for...
I am seeking Raytheon CB radios and walkie-talkies, in any condition (but preferably GOOD condition), along with parts, microphones, crystals, owner's and service manuals, sales literature, catalogs, magazine advertisements, and so forth.

I've already established that Raytheon's CB equipment was made by the company's Apelco division. I also know that Raytheon owned SBE from some time in the mid 1960s through about 1971 or 1972. The last two Raytheon CB models sold were SBE products with Raytheon logos on them. Apelco also made CB gear for Webster, Sears/Allstate, and other brands.

I'd like to correspond with folks who had some first-hand experience with Raytheon, Apelco, or SBE CB radios from 1960 through about 1972. If you worked in the CB business for one of those companies (manufacturing, design, sales, etc), or were an independent dealer who sold or serviced those brands, please contact me and share your experiences. Unless you have some real historical information, I'm not really interested in correspondence from folks who owned or operated those radios (nothing personal, but I'm really seeking historical data only at this time).

Visit my Raytheon CB radio web site:
http://www.qsl.net/k5dh/raytheon.html

Sorry if any hams are offended by my CB-related posts being placed on three ham radio newsgroups. The fact of the matter is that most of the Raytheon CB historical info that I've collected to date has come from hams and not from CBers!

Thanks and 73,

Dean W. Hemphill, K5DH -- Senior Technical Support Specialist

I think the book does dispel some myths but also creates some more. He oversimplied. His book leads one to believe that quads will alweays have moe gain than a yagi with the same # of elements and that beams have about 2db of gain per element. Have heard numerous people stating this as fact and giving his CB book as a reference. What the book does not say is that this is a generalization for most CB antennas with about 4 elements. Orr and Cowan should have explained the limitations of their book better. It would have taken precious little ink to explain that while each element adds gain each element

you add gives less and less. They could have also explained that while a 4 element quad will beat out a 4 element yagi that as you add more elements the yagi will eventually start having more gain than the quad. Thanks to Orr and Cowan's book we have people who are willing to go out and buy 8 element yagis beliving they will get 16db of gain or believing an 8 element quad is even better. I hardly call this dispelling CB myths.

2621. Copper Electronics "not so" Specials

Newsgroup: rec.radio.cb

rec.radio.amateur.misc

This is an email I received from Dan Asbjornsen (kb7uxe) regarding Mike
Laferla (k7jml) and his experience with a 10 Meter rig bought from
Copper
Electronics. The letter is addressed to Jerry Seligman (w7bun) who is
very
active with the Radio Club of Tacoma.
I thought you may wish to share this information with other hams.
-n7kn

Hi Jerry, my sad story goes like this:

Mike Laferla K7JML purchased an RCI 10M radio from Copper Electronics
(
mail order)
at a cost of just under $400... Mike had the radio for about 3 months
before he installed it and tried
it for the first time... It didn't work. It had cxr on am & fm,but no
audio,
and nothing on ssb or cw..
He sent it back to copper for repair or replacement. They returned it
saying
it was fixed..
When he tried it again, same thing, no change........ so he sent it back

a
second time...
and once again, copper returned it, still not working. once again, Mike
contacted copper
they wouldn't return his calls, or answer his e-mails. Mike returned the

radio addressed to the
the copper VP.. they returned it, unopened.......
Mike has spent just under $100. in return charges, and still, the radio

doesn't work, and it appears
that copper does not wish to face up and deal with the problem.....

Mike has contacted Ranger communications directly, and they have said,
THEY
WILL make it right...
(repair or replace ?)...
So the moral of the story,
DO NOT BUY ANYTHING FROM COPPER ELECTRONICS,
THEY WILL NOT SUPPORT WHAT THEY SELL....

Please don't confuse drive level with input power to the final, or with the
dead key (unmodulated) level of output from an amp..

Efficiency changes with impedance matching.

On a class A amplifier (NOTE THAT I SAID A CLASS 'A' AMPLIFIER) which is perfectly linear, the input power to the final would not vary with input drive level, the plate circuit impedance would always be the same value, the output tuning network required to match that impedance to a 50 ohm load would always contain the same values of input and output capacitance, the inductor would always be the same value, and your statement would be correct.

On a class B amplifier, the DC input power to the final changes as the RF drive level is increased which in turn causes the average DC plate current to increase.

As the DC plate current increases, the plate RF IMPEDANCE decreases, requiring different values of input and output tuning capacitance and a different value of inductance to regain the same plate efficiency it had before.

You can either tune for max efficiency at the dead key level, or tune for max efficiency at the peak power level, but you can NOT simultaneously have both.

If you chose to believe otherwise, that's up to you.

All I ask is that you try to be open-minded and run some tests using your own linears to see what type of results you get.

Try this:

Measure the DC input power, (I'm not talking about the RF drive power here, I'm talking about the DC plate voltage times the average DC plate current), to your linear when it has been tuned to peak efficiency while delivering a 100 watt RF power output level into a 50 ohm dummy load.

This experiment requires a HAM TYPE linear which has DC plate voltage and DC plate current metering, or someone with the skills necessary to measure these values directly in what could be considered a hazardous environment.

Then increase the input drive level, (the RF power into the linear), until you measure a new RF output power of 400 watts into the same dummy load, (WITHOUT

TOUCHING YOUR TUNE OR LOAD CONTROLS), and measure your DC input power again.

The final output circuit efficiency is equal to the RF power output into the dummy load divided by the DC input power to the final, (DC Plate volts times the average DC plate current).

Compare those 2 efficiency figures and see if your efficiency stayed the same at the 400 watt output level (without retuning) as it was at the 100 watt output level.

It is very important that you do not readjust your tune or load controls, because if you did that you would be adjusting your output matching network to the NEW PLATE IMPEDANCE, and there are folks here who continue to insist that will not be necessary because if the amplifier is linear the Plate impedance cannot vary.

Besides, if what they said is true, any such retuning should not get you any more power output because you were already tuned for optimum efficiency at that lower power level, right?

I will not debate this subject any further until a few good men have had a chance to run those tests and post their results.

Have fun and LEARN SOMETHING!

> showed a short and the fourth was very low but wasn't shorted. Should I
> expect anything else was affected or not.

You could have wiped out your bias supply.

You could have also wiped out the plate choke in the final (4 tube) amp. stage.

One thing that should not have happened was the fuse in the electric box
blowing before the fuse in the unit did.

Has the fuse been bypassed, or has it been replaced with a fuse from a solid
state linear which would have much to high of a current rating?

I believe that unit came stock with a 10 amp fuse in it, which would equate to
roughly a 1200 watt maximum continuous DC power INPUT level.

Unless your house fuses are rated at less than 10 amps, the fuse in the amp.
should have blown to protect it from self-destruction.

> Does anyone have some of
> these tubes for sale or know where I can get them reasonably priced?

Bob, N9TEW, who posts on here.

> I believe now that this operates in low power with one driver and two
> finals and high power with both drivers and all four finals. Is this
> correct?

No.

In low power mode it completely bypasses the drivers and uses only the (4) tube
output stage, which is a really nice feature if you want to have a higher power
export or a ham radio driving it.

> If so, I could change the bad with the good, and still operate
> on low while I wait for the tubes.

You can if you have (4) closely matched good ones.

And if you bias supply and plate choke are still intact.

> I was operating in low power when
> this happened.

Then your drivers were always like that, with one weak one and one strong one.

> I know this is very long but I couldn't figure out how
> to get my point accross in any less words. Any information would be
> appreciated. I just got this linear fairly recently. I'm used to solid

That's why you forgot to retune!

> Thank you very much for anything you can offer.

I provided what I could, but I'm sure that Doc or Hamm4fun or one of the other ham operator amplifier experts on the CB newsgroup can provide you with a lot more information.

Anyone open up the clarifier on the Superstar 3900? How many kc's does it move, and had there been any problems? I have heard that this mod is particulary hard on the pll chip of this radio.
Also, anyone out there got one of these rigs? What do you think of it? How's the audio, how is it for drifting around off frequency? Any feedback on this radio is appreciated. Inquiring minds need to know,
Jagzilla

End-fed half waves have had this characteristic since they were used on Zepplins. Without knowing a blessed thing about this version it doesn't surprise me a bit. Same reason you can hear the insulators on a transmission line on a foggy nite; the input impedance is a bit unpredictable.

Unless one is forced to by such things as fiberglass car, boat, or truck bodies no-ground antennas generally cause more problems than they solve. Wilson is as likely as anyone to have solved it and I may end up with hoof-in-mouth disease but for the moment, I doubt it.

alot of those radios are unstable. you should have gotten a little info instead
of doing a blind trade.

Unfortunately, there is no sanity test to buy a radio. Amateur operators also have a few lids in their midst. Most unfortunately, this causes many hams to point at the CBers and many CBers to point at the hams - a few bad ops make us all look bad. Despite someone saying you're trolling, my feeling is that the radio business should be relatively 'clean'. Anyone can be listening, and if memory serves me right, there were a couple of hams nailed a few years back for graphic descriptions of certain acts. Neither of the radio groups need these kinds of individuals.

For one, I have enjoyed both CB and amateur radio. I have found the CBers generally more amiable and I do tend to hang around the CB boards and NGs. I can't understand this 'drop the maul', 'vent', and 'cuss like a sailor'. None of my CB buddies was that-a-way. Matter of fact, the group I hung out with largely went on bunny hunts - with wives as well! We had a ball.

As far a 'dropping the maul' - the point is to choose the operating frequency so you don't need a KW. A friend of mine used to run 600 watts high level AM modulation. While he was bragging about how he could talk to South Carolina on 75 at night (75 is a nightmare of interference when it's busy), I'd have nice chats (at the same time) with Texas, California, or wherever on 160 (running 25 watts!). Maybe he was too lazy to put up a BIG antenna and depended on brute power. Who knows? Who cares? Myself, I enjoy a good solid 50 mile plus range 24 hours a day 7 days a week on 6 aa alkaline batteries. I don't need a linear.

Jerry,

You may very well be right. I miss the days (now 35 years ago or more) when there were local ham radio dealers and you could do a side-by-side comparison of rigs. Sure, you knew Collins was definately going to be better, but at 3 grand or so (back then!), you would settle for less. I will be checking for optional filters on any rig I get and will probably also check for any high stability options. Maybe I was too used to that Rhode & Schwarz receiver I used with that better that 1 part in 10 to the 8th per year max spec, but I honestly believe that I want to know what my frequency is - within 1 ppm as a worst case. Seems every time I get ready to purchase an HF radio, I end up buying something else - this year it was the computer and a digital camera (Kodak DC-240 with which I am quite happy).

Greetings!

A good point, which also leads to the obvious question.

So, how does a CB'er using an SWR meter, check SWR on SSB when they
don't have CW?

Answer = they don't have to - switch to AM mode and be done with it.

On Sat, 21 Oct 2000 07:49:50 -0700, while the modem was pondering it's
navel, "Charles Johnston" <charles@ab7sl.com> dissertated the
following:

>Hams never set or calibrate for SWR in SSB mode. Typically we choose CW and
>transmit a steady tone with it to calibrate and read SWR.

2675. Re: Antenna Directional????

Newsgroup: rec.radio.cb
Date: 2000-10-23 01:58:02 UTC
From: CodysPC@Iserve.Net
Message-ID: <39f395cd.26698198@news.iserv.net>
Source record: 56433

Greetings!

Not sure what the others are saying but with a Co-phased antenna system, properly installed, you obtain gain in the directions of the constructive interference pattern thats generated [in phase], and lose gain in the directions of the destructive patterns [out of phase].

The overall benefit of gain in a typical Co-phased system is to get directional patterns as you lose the omni-directional pattern that you would have if you only ran a single antenna.

Bandwidth is a characteristic of the antennas and the installation locations of these antennas. Poor location = poor performance and narrower bandwidth, Short antennas = poor performance and narrower bandwidth. Both the location of the antennas and the antenna types used, determine bandwidth.

Selectivity is a product of the radios' own ability to filter signals you desire.

However, selectivity can be enhanced by using the directional radiation pattern the co-phase system has over a single antenna - allowing you to hear stations with better signal using the axis of the co-phased pattern in their direction.

Hope this helps clarify...there's more...

An easier way to obtain bandwidth is to use longer antennas - and properly space the elements apart. Pretty much the distance needed to get the directional pattern is 9 feet apart. Less distance [closer] gives you less directionality but you still can obtain a greater bandwidth if you use longer antennas for your system *but* losing directionality also reduces the ability to "select" the stations you want to work.

In some cases, a co-phasing system is not the ideal choice, you'd be better off re-locating a single antenna to work a larger metal surface of the vehicle you're using to obtain the directional pattern [it becomes singular - helpful for cat and mouse games].

Like moving the antenna from the center of the roof to a rear deck or bumper [sigh] to get the "singular" radiational pattern needed for the directionality - and in doing so, you may lose bandwidth due to SWR intolerance - but you can get better selectivity of the stations you want to work by pointing the vehicle in the direction you want to talk.

On Sun, 22 Oct 2000 12:58:03 -0400 (EDT), while the modem was
pondering it's navel, twistedhed@webtv.net dissertated the following:

> Thanks, Andy! Yea, it sheds some light on it. I've co-phased at the
>base QTH before, with not much of a noticeable difference, in other
>words, the hassle vs. the benefit was not worth it. Never co-phased on a
>vehicle, but many of these good 'ol boys here swear by the co-phased
>systems on their big trucks, rigs and mudders alike for directional
>improvement, and many of the rigs they run, Cobra, Galaxy, etc., are
>mainly on the AM 11 meter cb freqs. So a co-phased setup on a vehicle is
>primarily NOT for directional improvement, but for better band width
>selectivity, which may or may not improve direction, right?

I have a handheld scanner, and some cb equipment in my car most of the time. Am I going to have any problems when I head to Canada on a fishing trip? I've heard horror stories about having equipment confiscated for no reason, but are they true? One of the other guys has a converted ham radio in his truck, will he have problems crossing? Thanks.

I took it two three different techs. The other two said they cant fix it because they cant get the parts. One was a repairman from radio shack. those are the only ones in my location that will work on CBs. the others (TV and VCR guys) say they dont have a ticket to work on them. If I never get it fixed it still will make a great 10 aa battery charger.

You bet, wile an engineer on tour with a famous rock star **
them creeps tore the tourbus apart.
Took guitars out of cases, sniff dogs
Took all the beer out of the ice boxes, scraped dried up bottles the of blue
drop
stuff used for the bathroom tanks.
They also confiscated the drivers Drake TR-4, a wireless guitar system, FRS
units, a Hustler magazine and a scanner.

To add they restopped us again after 2 miles and ran everyone license or
papers this time.
One guy had a DWI years ago in NY had to pay a non refundable $250 to
enter.
One guy who busted for pot in the 70 had to be sent back to the border.

Two things you should do before going into Canada.

1. Get a Canadian certificate from your car insurance agent. Do not need it to get in but it makes handling a thud-crunch all kinds easier. Remember you are in foreign jurisdiction and they tend not to let you or your car out unless there is money backing you. We do the same to them.

2. Be prepared to prove your right to enter the US, at the very least a birth certificate and a picture ID. Old passports work too. For very good reason, US border agents tend to get pissy without documentation.

With respect to your radio equipment, it is a problem in two parts. First is compliance with Canadian radio regs, the other is resale and duty collection. You may have to post a returnable bond for the latter which you get back when you leave.

1. Haven't got a clue on Canadian scanner regs.

2. Legal CB stuff should not present a problem.

3. There has been a posting that Canadian rules require an amateur license to own amateur gear. I can't verify it but your friend with the converted ham gear may have a problem on several counts.

Depending on where you are going, some provinces come down like bricks on Yanks who violate their fishing regs. RTFM! Probably not a bad idea to obtain some Canadian currency beforehand (to buy gas at 9PM) and to know the going rate of exchange. You will also get to make use of the klick scale on your speedo.

Great fishing though. Ever thought about just leaving the radio gear at home???

and then a reply from a canadian...

i wouldnt worry too much about your radio gear...we are far mor lax...than
your gov....ours will not spend a dime on radio enforcement....only problem
you could have is with a radar detector....and that depends on the
province....

Canada...the home of Export Radios

>True, but you get the greater bandwidth at the expense of symmetry.
>Without symmetry you'll get a directional effect. Usually co-phased
>arrays are intentionally arranged to be as identical as possible to
>create a symmetrical radiation pattern.

I think they were originally talking about co-phased mobile setups.. these are usually in the form of one antenna on each side view mirror.. A directional effect would occur if the antennas are not properly fed and the coax lengths are different. This is one of the few cases where coax length does matter, in that if the lengths leading to the two antennas aren't the same, a directional effect will occur...

>Thanks, Andy! Yea, it sheds some light on it. I've co-phased at the
>base QTH before, with not much of a noticeable difference, in other
>words, the hassle vs. the benefit was not worth it.

If you feed your two co-phased base antennas with equal lengths of coax, you will achieve a wider bandwidth and a wider radiation pattern, creating an over all improvement in the RX/TX, but the spacing has to be right between the antennas to see the difference.

Never co-phased on a
>vehicle, but many of these good 'ol boys here swear by the co-phased
>systems on their big trucks, rigs and mudders alike for directional
>improvement, and many of the rigs they run, Cobra, Galaxy, etc., are
>mainly on the AM 11 meter cb freqs. So a co-phased setup on a vehicle is
>primarily NOT for directional improvement, but for better band width
>selectivity, which may or may not improve direction, right?
>

That is correct. Glad I could be of some help! I personally use a homemade dipole, which sits about 8 feet off of the ground and I talk around the world with my setup...

Message-ID: <GfbJ5.18513$cO4.814064@nntp3.onemain.com>
Source record: 56600

I looked your radio up in the Sam's schematics. The transistor
you need is the 2SCF8. This is your final transistor. Here is a
list of transistors that will work in it's place,

ECG 237

NTE 237

2SC778

2SC799 (this is probably the most popular - found in older 23
channel type radios)

The ECG and NTE transistor replacements ARE still made but you
won't find them at your local radio shack! The 2SC799 is also
still made. There are many places you can buy them on the net.
Here are 2 to get you started. Do a search on these and you
should find the company's. They both sell to individuals and one
has a printed catalog.

Search for ..... MCM Electronics and Consolidated Electronics.
The second one has one of them for sure.

Now if you get this transistor......don't be surprised if it
doesn't fix your radio. Any tech that would throw away the only
part that was supposed to be bad without a known source for it's
replacement is probably hiding something. These tech's of yours
must not know to much about crossing parts. They would not need
to know how to work on CB's at all to cross this part, which
brings us back to the point, don't be surprised if that
transistor doesn't solve your problems. But, since they pitched
the original you'll have to get one anyway. Get the transistor
and take it to the guy and say "Here you go now please install
this part and fix my radio" Hopefully, he will and all will be
well. Cross your fingers!
Good luck!
Mike

Grab a pen or pencil and something to write on, here are the components
needed to perform the swing mod:

1. Two mounting screws
2. One piece of rope of atleast 26" in length
3. Cobra 29 ST (late model)

Directions:

1. Make a double knot on either end of the rope creatng an opening on each
end of atleast
3/8" in diameter

2. Attach one end of rope (which is now an opening) to the radio using one
of the mounting screws

3. Attach other end of rope (which is now an opening) to the radio using
the other mounting screw

4. Hold radio by the newly created rope "handle" and swing the radio like
hell.

5. Swing mod complete

Message-ID: <9roavsob6nmefdatii5jel7a7frh0ofisg@4ax.com>
Source record: 56605

Well this should stirr up some comments....Ok other than the A99 being quarter wave over half and Imax a 5/8wave in real terms is there a real difference in recieve/transmit? Was thinking hmmm..5/8must be better, but is it worth the money and effort to replace my A99 ?
I shoot lots of skip without the ground plane kit w/ the A99 but local isn't all the good. The match is 1:2:1 aprox. So you guys that have tried both lets hear some comments PLEASE ! Did u find that the Imax performs overall better or is it only a half an s-unit stronger? Can the match be as good as the A99? Also is there a ground plane kit for the Imax or do u need it? Lots of questions look forward to your answers...Keep up the good work posters......

I can't believe some of these answers. Canada customs could careless about radios or scanners ask any trucker. Canada customs is not going to ask to see a ham license, neither are the police.The police could less about radios/scanners. Industry Canada does not enforce the regs. unless some complains very loudly for a very long time. Don't worry about your radios.

Dwight which province does not allow portable scanners? Now if you break the rules fishing or hunting you are walking home.

Barry D.

$375 for a 2x4 amp? Damn son, you need to realize that there's wholesale and retail. Typically 2x4's retail from $399 - $499. Now add switchable pre-amp, switchable SSB delay, and class B biasing. I think the fellow got a fair deal. In a retail business you can't hand an amp out your back door for $20 over cost.

> Barry D.

Manitoba has a law that prohibits the use of scanners in a motor
vehicle. There may be exceptions to this, but the law does apply to
the 'average' person. You may be right about Industry Canada's failure
to enforce regs, but this is a provincial law, so federal bodies (with
the exception of R.C.M.P) typically would not enforce it anyway.

You're probably also correct in stating that no action is usually taken
unless there is a complaint. I only know of one case where equipment
was confiscated, but the circumstances surrounding the incident lead me
to believe that the person had actually drawn attention to his
activities in a rather negative way.

I have a Realistic TRC-212 (21-1662) for sale. This is the full size
40 channel unit with carrying case. High/low TX power switch. Around
5 watts output on high. LCD display with TX and receive meters.
Great shape. Original long (around 5 feet) center loaded antenna. Has
external antenna, power and charging connections. Has an 5-pin
external mic connector as well. Requires 8 'AA's or 10 'AA's
rechargeables and you can recharge the batteries WITHOUT taking the
batteries out.

Asking only $ 45.00 (US$) INCLUDING shipping from Canada
Great deal ! ! !!
A Picture can be e-mailed.

I agree..... I cross into Canada regularly from Michigan via as many as 5 different entry points (ferries, bridges, and tunnel)... I have had as many as 5 antennas and 4 radios in the car (HF, VHF, UHF, 11m, & 2 HT's), all in plain sight..... I've never even been asked "...What's all the antenna's & radios for?"... even in an OPP (Ont. Prov. Police) stop.

Wb4sqi,

Forget it. Your 29 will key 6.5 watts and
produce 30 - 35 watts modulated with a straightforward
tune-up. The mod you're looking for usually
destroys the final transistor(2SC2078/2SC2029/1)
within 90 days. You will never see the modulated
figures above with what you're looking for.

First of all 10 meter mobile radios like hr2510's and such are easily
modified for 11 meter use. and you still have 10 meter capabilty
Secondly 10 meter is quiet most of the time. there often isn't the
noise that you get on 11 meter and you don't have the "CB rambos" to
deal with. Though ocassionally a Ham will come in to harass everyone .
Third I find it funny that by FCC estimates there is three times as
may CB's as HAM's . But Hams have 10 times the band width and thier
numbers are decreasing. Those that are still in radio seem to be
mostly up in the higher bands. Many nights I have had the radio on 10
meters and there was very few if any US operators there. At least the
truckers make it interesting.

swearing all day on the radio? sounds like the classic "CB Rambo" or
"Welfare Radio" . When I lived in Troy NY we were overloaded with
them. I had one 2 blocks away that would always fire up his big amp
and play music on the SSB channels. I got pretty creative with him.
twice I called the power company and pretended I was he and had them
turn off his electricty. I had his cable TV turned off a couple times.
Finally he got the wrong people PO'ed at him and they beat him up and
took his radio, antanne and all one night

FWIW
1. The price of the amp on the Express web site is $475.

2. Express will match any price on the web, so look around before you buy.

3. Their tech support is always there to get on the phone RIGHT NOW when you need them. (As contrasted to the other guys who dont answer their phones for days or on end and take a week to respond to a email if they respond at all.)

In my experiance recently buying a radio, antenna and some other small stuff no other web retailer came ever close to being as good as Express and I got one hell of a deal. Could I have bought for less elsewhere? In this case No. Would I have paid a little more at Express if I had to? Yes. Ya get what you pay for.

My opinion, YMMV Nick

BTW, I have no connection to Express other than as a satisfied customer.

Tim,
You'll get opinions both ways. A local guy here just swaped his Maco V for an Imax 2000 and he does sound a tiny bit better. All you Maco fans, don't get your panties all bunched up over my last staement. The local guy felt that the Maco he purchased was never quite right from the get go; maybe it was just a lemon from the factory or damaged during shipping. Maco makes a good antenna, don't get me wrong.

Try removing the ground plain kit first. Depending on your local conditions, it may work better with or without it. With the time it takes to down the A-99 and mount the Imax2000 or any other 5/8 not to mention the $$$ involved, you won't be satisfied with the "upgrade".

If you really have some money burning your pocket, keep the A99 as a copy stick and purchase some beams. Time and money spent with beams always has a higher pay off.

Tim,
Save your money. While there ~may~ be a difference in
peformance between the two antennas, it would be measured
in 'fractions' of an "S" unit, and it could go either way.
The only time you will hear a big difference in signals
when swapping between two 'simular' antennas, is when the
original antenna is a real 'dog'.
'Doc

If they will match any price on the web then they better drop the price on the x force products they are severly over priced lets assume he bought a straight am model 2x4 at $475 compared to $375 from the other guys. ok $100 difference that is $100 more than i want to pay for something when i can get it for less... maybe you have money to burn but i don't.. almost 25% more

2751. loaded antenna questions

Newsgroup: rec.radio.cb
Date: 2000-10-24 00:00:00 UTC
From: thunder <thunder@cinci.rr.com>
Message-ID: <gxmJ5.222$aG.320@typhoon.kc.rr.com>
Source record: 56660

I am fairly new to the CB world and have a couple questions. I have read on a few sights that top loaded antennas are better than bottom or center loaded antennas, but having said that aren't examples of top loaded antennas the firestick and say the Wilson silverloaded fiberglass antennas. Then I'll read on this board that the fiberglass antennas are junk compared to stainless antennas such as center loaded solarcon coil type or a Wilson 2000 center loaded antenna. Can you give me examples of top loaded antennas and are they worth it ? Our company uses sterling trucks (hard to ground) so they have put mounts on back of the cabin. So the antenna only has a limited exposure after it clears the air shield and the trailers. All opinions welcome and thanks for clearing up my confusion.

yeap, sound like either that or the guys on 20 and 75 meters. take a listen to the maritime net getting jammed from time to time while trying to do important stuff or 14.313 with the foul language thats common. or listen to all the guys with henrys and alphas running 2500 watts+ on 14.295 acting like its 27.025. should i even mention the crap on 75 freqs like 3.950 and the constants fights between the guys running 3.922 and 3.925? sounds like radio hambos or welfare hams to me.

i think you need to read thru the post. the subject here was jim stating he liked the 50 mile coverage he gets with his 8 aa batteries. it had nothing to do with a mobile or base rig and a ringo ranger. i dont think your going to get anything over 5 watts on aa bateries much less 100. my point was those batteries wont get him more than a mile when a storm comes and knocks down the repeaters like happens after a big hurricane. i'm thinking your a nocoder with a chip on his shoulder. a real ham would know the extra 3db going from 50 to 100 watts insnt worth the extra current or heat anyways. see ya

Bill, do you have a problem understanding simple declarative sentences? What part of the following sentence from my post do you not understand?

> 2. Express will match any price on the web, so look around before you buy.>>

"Look around before you buy" Got that?

"Express will match any price on the web" Got that too?

Now, FWIW, I checked the Express Electronics site, Panter site, Bills 2 Way and Exports R US, and the only ones to list the XT 400 amp for sale were Exports R US for $459.99 and Express Electronics for $474.99. A difference of $15.00. Now I would pay $15 more from an outfit that answered their phone whenever I called and helped me right away with tech support. (I called Exports R US 4 times a day for 3 days straight and not once did they pick up the phone) But I would not have to pay the extra $15 because Express would match the price, and if I found it cheaper somewhere else (your mythical "other guy"), they would match that price. (Just like I said in my post).

Please read this carefully Bill because I dont want to have to go over this for a third time.

LOL . I like that "Hambos" I 'm on the road a lot these day and it seems that the CB channels have cleaned up a lot overall. especially 19. I don't even hear the "welfare radios "(you know the type a 23 channel Kraco with a 500 watt Tube amp plugged in it) much anymore either. I certainly hear more of it on the Ham bands these days. 75 meters does seem to be the worse. Rich

This is why the book is bad, You really believe this to be true. It should have said double the number of elements and qradruple the boom length. Ever wonder why hi-gain arrays use Yagis and not Quads. While I cant say he is wrong he just did not tell the whole story. This kind of omission is almost as bad as a lie. I also dont believe it was the authors who made the omission. Without all the info which he gives in his other books all the book did was create another misconception. One that a lot of CBers have wasted their money on. The book gave the green light to selling 8 element antennas on short booms as some sort of super antenna.
I think most CBers can understand the theory. There are those that cant understand the math but they could probably do the math if given the formulas and this is all that other more advanced books do unless you get into text books.

If you really want a good book there are several that spell it out. An antenna with this many elements will have this gain. This is how element spacing(boom length) effects gain. This is what happens to a quad when you add more elements. All written to a level most anyone can understand. I would start with Orrs radio handbook. Joe Carr has a good book and the ARRL publishes a good book. None requirre any extinsive knowledge in math or electronics to understand.

Its not what that was put in the CB antenna book that is so bad, it is what that was not put in them.

2761. Re: loaded antenna questions

Newsgroup: rec.radio.cb

thunder,
While it's true that top loaded antennas are more efficient
that center loaded or bottom loaded antennas, the 'hearable'
difference is going to be very small, if you can hear the
difference at all.
If the wind deflector isn't metal, it has no practical
affect on your signal. If it is metal, I'd sure think about
moving the antenna somewhere else. Loosing a few feet in
height, but being in the 'clear', would be a 'plus' for you.
'Doc

Nick, or is it Dick, suck my ass.. you are the asshole that keeps buying from guys like expresselectronics as they get rich you get poorer. Ill say it again real slow since you have trouble comprehending .. If they will match any price then they can match the price of a davemade 2x4 for $375 You did say they will match "Any Price" and an x force is an exact copy of the davemade so why pay $100 dollars or more for a comparable amp that is a direct copy of the other? because you are a jackass and need the "Tech Support Hotline" maybe for the extra $100 ... So go and pay the extra $100 since you got it like that Dick i mean Nick. I would prefer to save the $100 and apply that towards my radio but you sound like a brain surgeon what would I know .. I hope they see you coming again next time..
..

looks like you get it from both ends north and south and east as well ,
i suppose whenever some of them make through. here , our problem is
from the south, they work cheap, live 20 to a room, fuck up the wage
schedule for american workers, drive the wrong way on one way roads,
because they can't read english, play their stupid music loudly in the
parks, which they own on weekends,and why not considering somebody else
is paying for the upkeep, have their babies in public hospitals which
immediately become american citizens by law, and do not pay one red
cent towards the cost of their delivery. and oh yes, they consider this
area to be part of their country, ain't that something, my , my. wake
up folks, our culture(if there is such a thing) is dying. and i blame
it all on our crooked politicians, who upon entering the washington dc
area immediately become somebody else besides who was elected, oh my,
duck hunter is out.................

2770. Re: What is antenna Gain ?

Newsgroup: rec.radio.cb
Date: 2000-10-24 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <39f60c3d.1799095@news.iserv.net>
Source record: 56679

Greetings!

Now I see why you're so against this book.

Hmm...the subject of Yagis and Quads are your irk. [It does say in the book that practical size is the limitations.] Multi-element beams are not everyones cup of tea.

And in my opinion, I never can see myself owning a monster Quad or a 3-element Yagi in my near future - I just don't have the space in my yard! [LOL!]

All I can say is,

"Why don't you print a book to dispell that myth?"

Then we all can scrutinize your work.

Orr and Cowan did take the time to explain a lot of other "little" things that make this book a worthwhile reference to have.

As far as oversimplification, the books initial intent was to bring Antenna theory to the masses, for the real truth about antennas. I can hardly call that a failure. It does point out the companies that make wild claims about gain may not be telling the truth about antennas. The whole purpose of the book, for back then, was to get the straight story on all these antennas.

[And there was a lot of companies back then vying for your hard earned cash!]

Because of the books desire to tell the truth about gain factors, the CB antenna market has taken [IMHO] a sharper turn towards a smarter operator that doesn't get suckered into buying an antenna that has greater gain than a dummy load, e.g,- unbelievable gain compared to a dummy load but less gain than a dipole. [The dBi vs dBd debacle.]

Hence, better competition, not exactly honest, but better. But, back then, it was a lot worse than it is today in trying to make the right choice.

And it doesn't say it's a "Cure all" - it merely states in it's own opinion what you need to know, that is based upon basic fundamentals and simple facts. [It's suprizing to see how many CB'ers can still benefit from the knowledge in this book.]

To be honest, even Carr's "Antenna Handbooks" don't go into the details in a simplified fashion such as Orr and Cowans' efforts with

this book did, in fewer pages.

To me, the book set a precedent that in order to keep people informed
about scruples that companies will advertize, knowledge helps the
operator make the right decision. Proper installation of any antenna
makes the system work. If you don't do it right, no matter what you
use to power it, performance will suffer.

That above paragraph is why I promote the book.

Caveat Emptor!

2772. Re: Firestik Fire-Up 99 for the Antron 99 - Any Comments

Newsgroup: rec.radio.cb
Date: 2000-10-24 00:00:00 UTC
From: CodysPC@Iserve.Net
Message-ID: <39f61530.4090024@news.iserv.net>
Source record: 56681

Greetings!

[I'm cc:-ing this to Firestik as well...

Although they claim it's better there are a few "vague" references to
such things like...

Current slows and voltage increases? [Ahemn...] The speed of light
hasn't changed recently, or does Firestik know something than Einstein
and Hawkins didn't?

Its more like, "The antennas design takes the current that
would otherwise have generated heat and a magnetic field that
would not provide any extra voltage gain had it been left as
a straight wire, and converts it to a voltage wave to help
improve propagation of the RF wave away from the antenna.
Thereby increasing conversion of voltage and current to
increase efficiency of the top section by changing it's
electrical properties."

And in reference to 25-35 mile stations, 1 or 2 "S-units" increase
generates the following...

Show me any CB radio that faithfully follows the true
logarithmic scale - and I'll show you the radio you should
use to do these tests.

Show me the other antennas that were used at the other
receiving stations - and I'll show you some true competition.

The only thing they've done, is increase the amount of inductance at
the top by using a top loaded coil. This naturally generates more heat
and changes the electrical properties of the top element - which
affects the antennas overall performance.

Subject:ADDITIONAL Signs in a Kitchen

Pick your favorite!

1. Kitchen closed ... this chick has had it!

2. Martha Stewart doesn't live here!!

3. So this isn't Home Sweet Home ... Adjust!

4. Ring bell for maid service. If no answer, do it yourself!

5. I clean house every other day. Today is the other day.

6. If you write in the dust, please don't date it!

7. I would cook dinner but I can't find the can opener!

8. My house was clean last week, too bad you missed it!

9. I came, I saw, I decided to order take out.

10. If you don't like my standards of cooking ... lower your standards.

11. Although you'll find our house a mess, Come in, sit down, converse. It doesn't always look like this: Some days it's even worse.

12. A messy kitchen is a happy kitchen, and this kitchen is delirious.

13. A balanced diet is a cookie in each hand.

14. Thou shalt not weigh more than thy refrigerator.

15. Blessed are they who can laugh at themselves for they shall never cease to be amused.

16. Countless number of people have eaten in this kitchen and gone on to lead normal lives.

17. My next house will have no kitchen ... just vending machines.

18. I'd live life in the fast lane, but I am married to a speed bump

2780. HUMOR (IT's Football season again)

Newsgroup: rec.radio.cb
Date: 2000-10-24 00:00:00 UTC
From: bobr19@aol.com
Message-ID: <20001024195318.00193.00001049@ng-cq1.aol.com>
Source record: 56689

It's Football Season Again. Something to offend just about everyone...

(1) What does the average Minnesota player get on his SAT's?
-----Drool.
(2) What do you get when you put 32 Alabama cheerleaders in one room?
-----A full set of teeth.
(3) How do you get a Wisconsin cheerleader into your dorm room?
-----Grease her hips and push like hell.
(4) How do you get a Florida State graduate off your porch?
-----Pay him for the pizza.
(5) Why do the University of Oklahoma cheerleaders wear bibs?
-----To keep the tobacco juice off their uniforms.
(6) Why do they no longer serve ice at Pitt football games?
----- The senior who knew the recipe graduated.
(7) Why is the Indiana football team like a possum?
-----Because they play dead at home, and get killed on the road.
(8) What are the longest three years of a Michigan football player's life?
----His freshman year.
(9) Why did Florida State replace natural grass with Astroturf?
-----To discourage the cheerleaders from grazing during games.
(10) How many Tennessee freshmen does it take to change a light bulb?
-----None.....That's a sophomore course at OSU.
(11) Where was O.J. headed in the white Bronco?
-----Lafayette,IN ...He knew that the police would never look there for a Heisman Trophy winner.
(12) Why did O.J. want to move to Blacksburg, VA?
-----Everyone there has the same DNA.
(13)Why did Tennessee choose orange as their team color?
---You can wear it to the game on Saturday, hunting on Sunday, and picking up trash the rest of the week.

Hi.

I am looking at buying a new CB. I have some questions as to what Single Side Band and AM channels do for me. Do the AM channels allow me to listen to radio stations that my regular car radio can't pick up?

Also, does anyone have any experience with the Uniden 538W or 520XL?

Thanks,

John

A few of us discussed placing a 102 inch whip atop an Antron here on the ng not too long ago. I've had several indications from separate folks locally that this improved their reception and/or transmit. As you say, terrain may play a part in this. Or it may be that swamp cabbage and 'shine.

Even after paying the $25.00 membership fee on a previous order, an EL-509 (1 piece) to the door is $46.00.

Guess That takes me out of the running for the "Rocket Scientist of the Month Club".

Another internet retail outlet would be a more sincere possibility , and probably cheaper then these "distributors". Copper now charges yearly "subscriptions" for their catalog.

At least with H&Y you often get the choice of a number of different prices for the same piece of gear. It is not uncommon for them to list the same item more than once in the same flyer, at 2 different prices.

I have always heard "where there is smoke there is fire". I went with H&Y due to the flap about Copper before hearing that they shared a warehouse in common. Live and Learn.

Not to mention the growing number of "National Hispanic Channels" taking over the CB. Channel 10 is used by Hispanic truckdrivers, bumpertalking right through communities attempting to carrying on normal communications . We are still trying to decide if they are a 2 driver team passing the mic from one seat to another, of if their bumpers are just chained together. They will disrupt communications on average of 30 minutes per pass along I-95 affecting local talk in a 25 mile range locally. The speak the poorest Spanish I have ever heard, and if you use a beam antenna to pick them up approaching the area, you can hear them switch from english to their highly animated version of spanish patwah about 10 miles south of here, just because they know it annoys the local CB community. These are real sterling additions to the population. I don't think I have ever seen an example of lack of self respect so flawlessly presented as they do to themselves and th eir homeland, as witnessed by their actions and attitude.

FWIW, Channel 19 won't let them carry on in their Broken Spanish agitator language, so we have taken to getting the simplex repeaters that Radio Shack sells and setting them up on old crystal rigs that can do split channel operation. This allows for receiving 30 seconds on channel 10 and rebroadcasting 30 seconds on channel 19. The Channel 19 crowd gets the distinct pleasure of hearing 30 seconds of bleed-over followed by 30 seconds of rebroadcast of the previous bleedover, now on it's not bleed over. This makes for what is referred to s "Self regulating highway conditions", and there seems to be an epidemic of hispanic operated 18 wheelers attempting to drive across the marsh for some reason or another. We haven't fully figured it out yet.

More than one way to skin a cat......

curious_dan,
Now, do you really think the FCC isn't/wasn't aware of the amplifiers, etc, being sold on the inter net, or eBay? If your going to place blame, why not put it where it belongs. You've got to admit that advertising a device for sale that you know is illegal, just isn't the smartest thing in the world.
As far as the amplifiers that use 3CX3000a7's, it really doesn't make any difference what the ~potential~ output power could be, it does make a difference what the actual output power is. As far as abusing the power limits is conserned, I agree with you.
It is certainly your privilidge 'not' to earn a license. I think you should do as you feel is 'right' for you... as long as it isn't harmful for others.
'Doc

IT'S A DAMN SHAM THAT YOU PATED 100+
FOUR A AMP AND YOU ARE GETTING ALL OF THE DICK HEAD'S ON YOUR ASS!!!
BUT WHEN I HAD MADE THE "CLASS B"
AMP WITH #12 ILL.
WE PRICE IT AT $20.00 PER. STAGE.
SO IF YOU HAD A 2-PILL IT WAS $20.00 MORE OVER THE PRICE OF THE AMP.
NOW IF YOU WOULD NEED A SWICH TO TURN YOUR SSB ON & OFF THAT WOULD COST
$10.00
IF IT WES ON SSB ALL THE TIME IT WAS FREE...

NOW I CAN'T TELL YOU ALL HOW THE X-FART TEAM IS DOING IT NOW!!

AND WE ALL KNOW WHY THAT IS../????!!

SO ALL I SAYING IS THAT IF YOU GOT FUCK BY WHO EVER YOU GOT THAT SHIT
FROM THAT'S TOO BAD!!!!!!!!!!

AND YES THIS IS THE "123" THAT STARTED THE X-FORCE LINE.....

2805. Re: Galaxy 77 mod yea or na

Newsgroup: rec.radio.cb
Date: 2000-10-24 00:34:52 UTC
From: fire228@my-deja.com
Message-ID: <8t2lfcvts1@nnrp1.deja.com>
Source record: 56583

Charles,

This is another "garbage" modification. Besides completely destroying any linearity the transmitter might have had, it is also extremely hard on the 2SB754 pass regulator as well. Most commonly used by "chop shops" who are unable to properly tune the transmitter in the first place. Case in point: Had a 77 Galaxy come thru the shop yesterday with the 1N400? diode in series with R238. Transmitter tested at 25 watts out on am and only 5 watts output on ssb. R249 was clipped out, disabling the amc on am. The tank circuit wasn't even tuned for resonance.

After "undoing" the mod, the transmitter was properly aligned. R249 was resoldered and the diode was removed from R238 and the resistor re-connected to the foil on the board. 40 watts out on am and 46 watts on ssb. No added or removed components. Then the "additional" talkback circuit on the bottom of the board in the audio section was removed. The loudness and clarity of the talkback in these and other similar radios is entirely dependent on proper alignment of the transmitter. The more power the transmitter develops, the louder the talkback becomes. Since most shops are unable to tune the transmitters properly, they have to add their own talkback circuit so it's loud enough to be heard. More garbage.

The guy who had worked on this 77 was so proud of his handiwork that he displayed his "handle" on a sticker placed on the side of the covers. "WIZARD".... Don't know who he is....I now know all I need to know about this guy. No Radio Technician Here.

Other than the obvious things listed above, The rest of the radio was virtually "untouched". No attention whatsoever was directed to the receiver front-end, which didn't hear well at all as indicated by the shop signal generator. Heard really well in the 10 meter amateur band, but by comparison was "deaf" in the 11 meter band. I won't even go into to detail in regard to the fm and ssb sections, or the fact that the thing was 1400 hz. high on frequency with the clarifier at 12:00.

The customer informed me that "WIZARD" spent a whole 15 minutes on this job. cost to him was $25.00. This radio and others like it require a good hour of bench time to set up properly. No parts in, no parts out. I politely informed the customer that with repect to the work which had been performed previously that he "got what he paid for".

hamm4fun,

It' no cb myth that a 1 wavelength loop produces more signal
in the desired direction than a half wave dipole. I thought he
was extremely thorough when he explained that every time the
number of director elements are doubled that roughly a 3 db.
increase in gain could be realized. He was speaking of the yagi
type design when he made this statement.
Element for element, the quad will outperform the yagi every
time, especially at lower mounting heights. No myths here. This
has all been born out over the years, in actual experience and
in fact.

You wrote:

They could have also explained that while a 4 element quad will
beat out a 4 element yagi that as you add more elements the yagi will
eventually start having more gain than the quad.....

The only way the above statement would hold true is if you never
added another element to the 4 element quad.

He tried to talk down to cbers
and some of them still didn't "get it"!

Hippie Freak,

There's not much you're going to do to change this, even
if you get rid of the duals and go back to a single antenna.
The reason for this is the geometry of the truck/trailer.
Since the direction in which the longest path of truck and
trailer are to the immediate front and rear of the cab, you
will always experience more or less of this "effect" as long
as you're using any radio in this truck. For most truckers
this is usually a desired trait, as they generally want to
concentrate most of the systems energy up and down the road
in front of them, as well as to the rear. Try another vehicle
besides a "big rig". Another option would be to experiment with
different phasing arrangements in a effort to make the pattern
from the dual antenna system more omnidirectional.

True, but Tim's repeater (WB2KAO) has only been down a few hours since I got my ticket back in 1993. The WA2EGL repeater (Kodak Elmgrove plant) has also not been down except to be relocated from Elmgrove to the Park. I sometimes use the megaplex repeater system (all linked to each other covering 10 meters, 6 meters, 2 meters, and 440 MHz) - and can hit 3 of them ... haven't ever heard them down; certainly not all at once. That leaves only 7 more repeaters (including two on Bristol Mountain many many miles away) I can hit from my living room with those aa alkalines. I don't know if any were down during the ice storm of 91 - most were up. Of course, the batteries could go dead - i've only the 1 NiCad. Oh, and a set of nickel-metal-hydride. And about 4 dozen new aa alkalines sitting around here. I will admit to having the radio go dead during a qso. Stops me for about 30 seconds, tops. (this does not happen with the alkalines as they give me a few minutes of warning - its the other types that die very quickly)

well charles, do you think moses is going to get the vote out?, i don't own any guns yet, but i believe in the second ammendment for a variety of reasons. it makes it real hard for a overbearing government to do what they want, when there are individual property rights, and gun ownership. i am going to join real soon. also i am going to pick up the slack, where the united way, is dropping the ball, supporting the boy scouts, all because this fine organization doesn't want homos as scout leaders, aint that a bitch, oh well, duck hunter is out.....

Thanks, Jerry

I know what you mean. I have repaired surface mount stuff. It is not fun anymore. The stuff is getting really tiny. I am now into robotics and PLCs. At least the smallest stuff you find now is M3 hardware or 6-32s (once in a while a 4-40). At least I can SEE the dumb things. And the programming is easy - unless you get stuck with one of those fancy ergonomic keyboards that are twisted in the middle. How the heck can anyone type more than 30 or 40 WPM on those things beats the heck out of me!

Cross-posted to: alt.radio.scanner,rec.radio.cb,rec.radio.scanner

scanners are ok, but portable scanner regs vary from province to province.

CB's are absolutely no problem, as longs as they are unmodified. The same with the Ham equipment, by treaty, a US HAM can operate his unit in Canada, have him look here to see if he is covered

http://www.rac.ca/faqgovt3.htm

If you want, I will post you a toll free number for canada customs and they will be more than happy to answer any questions.

Comments made in this thread about problems at customs and with fishing licenses should be noted. Especially the statement about making sure that you have proper papers to get back into the U.S.

The customs officers here are nowhere near as bad as they are made out most of the time, just be polite and honest, and don't think that because they don't have guns that they can't make your life miserable if you provoke them.

Proper fishing licences and adherence to quotas is important. Canadian law does permit the confiscation of vehicles, boats and tackle. Don't take this personally though, the same laws apply to Canadians.

All that said, come on up! We have the biggest meanest leader chewing, lure swallowing fish you will find anywhere. And the best beer to wash down your buddies fish tales with, once you are back at the dock. The only bad thing about coming up this time of the year is that you will miss out on our misquitoes, which make our fish look like minnows!!

Here's the situation. Have your buddy call the Police to document complaints of trespass and criminal property damage. Have him setup monitoring cameras concentrating on the antenna farm for proof/evidence of that knuckleheaded neighbor of his damaging his antenna setup. Once he has documented Police reports in hand as well as video, have him take the "sumbitch" to court and sue his ass. When that doesn't suffice, call up one the KW CBers from around the town and have him lights-out that friggin' jackass (joke). Keep it going through the legal system for now. Whoop his ass later... juss a thought...

> Paul

Good point, Paul. While no one can accuse most CB linears of being the leading edge of the art they are a tremendous improvement over the days of stealing a power transformer out of a TV set, putting 6 or 8 skittish sweep tubes in parallel thru a common parasitic choke, and cooling the whole shooting match with a phonograph motor and sheet aluminum propeller.

Prohibition has an amazing habit of producing bathtub gin and strange guys in gas masks making amphetamine.

Well, aren't the superham tattletales in overdrive. Instead of directing their
energy to cleaning up their own airwaves, they just CAN'T STAND those CB'ers
selling Galaxies and small amps among each other on eBay.
WAY TO GO ham community! Why don't you invest your time into something
constructive like neighborhood watch, reporting drunk drivers, protecting our
2nd amendment, or better yet clean up your own back yard.

One of the first problems you will run into is a limit on how high the
antennas may be mounted at most keydowns.

Tim, 5 watts from a VHF handheld is going to have more range than 1 mile.
Probably more like 5-10 miles depending on terrain. If your on a hill the
range can be even greater. see ya

Tim looks like your wrong again. The majority of repeaters up here in
Canada have there own tower. Christ I have my own tower in my back yard.
Most of my Ham friends have their own tower ranging from 32' to 100'.

In addition to amplifiers, it my understanding that eBay has been targeted for the monitoring of CB auctions containing the terms "Tweak", "Peak", and "23 Channel".

In the legal sense, 23 channel radios were outlawed for sale about 6 months after the introduction of 40 channel rigs.

This seems somewhat anal retentive, but I don't think I would trust any other approach from our great governing overseers as being sincere. There should be some common ground in between total control and anarchy that is clouded by the introduction of reason.

I think that there may be a need for some monitoring and regulation just to keep the spectrum allocated to CB usable to the point that it isn't abandoned to be auctioned by the FCC. By this, I mean that 26.965 to 27.405 should not ever evolve into a 24/7 "shoot-out" such as what is witnessed on channels 6 and 11 90+% of the time. This is not meant to be a racial slur, but it is the way things are. When someone has the channel tied up for 5 minutes of "broadcasting"; with no semantic value in the transmission, it tends to discourage others from trying to use the frequency. Actually it prohibits use of the spectrum 20 to 30 kHz above and below the channel of operation. With only 455 kHz of spectrum holding down the actual CB allocation, it would only take 10 channels participating in a contest of "who has the biggest thing" mentality to invalidate the spectrum and render it fodder for government auction. If CB becomes so unusable that the band starts looking deserted by all but the 5KW club, you can count on it being taken away and put up for sale. This happened to part of the 1.25 meter ham spectrum on an auction to UPS. It wasn't due to powerhouse stations, but due to what the FCC viewed as not enough utilization to justify it's allocation to a hobby-type group. Due to the governmental red tape machine, UPS was so delayed after the purchase in a Spectrum Auction where they "Purchased" the rights to that spectrum, taking it away from the Amateur community that they had to result to cell phones for it's intended purpose. Now, it is not usable by Hams and not being used by UPS. Sounds kind of futile doesn't it? 11 meters is not exempt from this scenario being repeated......

The CB spectrum is HF, and provides for world-wide coverage. For this reason, it is viewed as an asset by the government. Asset forfeiture rulings have spewed forth from the halls of justice at steady rate for some time now. It isn't really a topic that takes the "rocket scientist debating team" months to figure out.

The same phenomenon took place in the early days of Low Earth Orbiting (LEO) Amateur Satellites that provided FM "repeater" operation worldwide. There is a very low signal loss noticed in free air transmissions. A 2 to 5 watt

handheld had the potential to work the world via the OSCAR satellites, and it was not an uncommon occurrence. Mobile operation was easier, and Base operation was like "shooting fish in a barrel". Pretty soon someone comes along and doesn't take the geometry of elliptical orbit into account, and can't understand why he can't talk the full duration of the orbit and every orbit. He responds by increasing his output power to compensate for his lack of understanding. Soon after, others follow suit, as it is easier to buy an amateur VHF or UHF amplifier than to study the dynamics of satellite communication, and it requires a lot less responsibility. Now everyone is hitting a "bird" that is designed to increase it's output power in relation to the received signal strength, which it does..... Now the battery management systems onboard begin to face early retirement, and the control operator has to employ onboard attenuators to keep the bird from burning itself out. The ones down below find it easier to buy a bigger amplifier than to understand what is going on and how they are causing others to not be able to access the bird with the equipment it was designed to work with. Pretty soon, the medium that was put together for access with 2 watts is so heavily attenuated that it takes an excess of 100 watts to produce the same received signal that 2 watts would have without attenuation. ..... What I am saying here is this is not a CB only phenomenon. Responsibility is a two-way street leading to all aspects of life; even our hobbies.

During the sunspot peaking we are in the middle of, even 100 watts is seldom enough to yield 5 mile dependable communications. The understanding of propagation and 11 year sunspot cycles have been around as long as we have had any understanding of radio waves. Buying a bigger amp is a toss-up between getting longer range and creating more noise for others to deal with. During the 5 1/2 years of non-peak activity in the cycle, 4 watts is more effective than 100 watts is during the 5 1/2 years of peak activity. It is highly questionable logic for someone to try to overcome a natural phenomenon by bringing more power online. The ratio between the benefit of extended range and the additional noise for everyone else attempting use of the spectrum to have to try to overcome doesn't show this to be an overall beneficial approach to take in doing battle with mother nature.

I know this response has evolved from amps, to useless bureaucratic control measures to entirely philosophical. It isn't aimed at anyone in particular, and certainly doesn't offer any easy solution. It is just a little nudge toward a degree of mutual understanding of the problem we are facing. I would advocate trying to affect the things we have control over, while not wasting resources trying to overcome something we cannot ever hope to control. Putting another kW in the equation adds QRN to the QRM that nature allows for. All we hear on the receiving end is Noise. It is not Q-specific.....(I guess that makes it P.C.)

Making the top section a little longer helps. To get my Antron to tune on CB I had to run the rings all the way to one end(bottom I think). Replaced the factory whip with a 102 inch whip and set the rings to the middle and trimed the whip for lowest SWR in the middle of the CB band. Results were a lower SWR and possibly a slight improvement on receive would not even hazzard a guess on transmit. The Antron works better on 10m than 11m as it comes out of the box. Lengthening the whip optimizes it for 11m.

hi david very nice post but i totally disagree about cb being auctioned off. this will never happen simply because there are too many users regardless of the power levels. this high power is not some new fad. its been going on forever. also cb could never be sold for anything worthwhile because there are too many foreign users. just listen to usb on the freqs above 40 and all day everyday youll hear every country in europe, africa, south america, and oceania going strong. its not just us here in the states and the fcc has no control over what those people in those places do. this band will never be anything but what it is now. the proof is there. the cb'ers have driven off the legetimate users and taken over there spectrum. its not going to reverse itself. but i do commend you on your talk about the leos. more proof the hams are just as guilty as the cbers they just dont like to talk about there own troubles. a man is no different regardless of what band he uses or what callsign he has.

You are a MORON!! I was refering to the way you mispelled
business [you spelled it Bussiness] Doye! (not a word) Doye!

>If firestik could make it work, they would have marketed it. Remember
>they are a BUSSINESS (Doye!).

They did, that's where I got the idea! Doye!

> 2) Still no Balls to call firestik and find out what their engineers have
> to say about the Imax 2000 plus firstik?

Who cares! {I might do it now just to congrat the makers of a fine product}

> 3) Call them and then come back to this NG, nards in hand, and post what
> their testing revealed. (by the way, "nards" is not a real word!)

I don't care about their testing. GET A LIFE! The I-MAX 2000 and the A99
are the same type of antenna. If you called any company about thier product
and asked about useing it for a unrecommended use, they would advise against
it. Go back to playing with your nards.

> 4) Still think you sell shoes at K-mart!

Up Yours! Your Projecting!

> 5) Until you contact firestik and have the guts to HONESTLY post what
> they say, I am done with you. BYE..BYE!

It's mutual, Your too stupid to waste any more time on. This whole stupid
spasm of yours is over the fact that I saw Firesticks add for the A99, tried
it on my I-MAX, it worked for me. So I posted my findings on a public News
Group as a freindly FYI. Then you peel yourself of your wall with nards in
hand, professing your position as HEAD MORON. Get over it Geek!

> > > > > > --
> > > > > > THANK YOU: Scott!

Your Welcome! Temper - Temper, take your meds, remember deeps breaths. It
was fun while it lasted. BYE-BYE, have a nice day. ;o)

That's 10 less crappy-sounding amps per week that make it onto 27 MHz. Nothing wrong with that.

bob, your still missing the point. everything you said was valid and i wont disagree. fact is without those repeaters AA batteries aint doing jack and that was the origanl point of this thread. all this other stuff is redundant. your preaching to the choir. like i said cb'ers have been qrp'ing it for years on HF and never even knew thats what they were doing. 90% of every station ive ever worked on 11 meters from east europe and the soviet breakaways were running 12 watts, stock mic, and a dipole or antron with just fine results. and yes cops use handhelds but again its with repeaters. and just so youll know when a big class 4 or 5 hurricane comes thru there arent many houses and no towers left standing. dont worry about finding which tower excatly it was because i do belive you. fact is though you sure as hell cant rely on there being one left. your better of with a g5rv, 100 watt rig, and a car battery then youll ever be with a vhf or uhf radio. where you guys live may be a richer area then here i dont know. i do know there are very very few 100+ foot towers privately owned in my corner of texas and thats all i can speak for.

So Tim how long is your 100 watt rig going to transmit with a car battery?
Not long. Perhaps you could turn down the power and it might last for a
while. Which band are going to use? Since you would want to communicate
locally 160 meters or maybe 80. Since all the towers and houses are gone
what are you going to string your 200+ foot G5RV up to?
Who are wishing to communicate with? Local emergency crews I think. They
do not usally carry HF equipment. They have VHF equipment. So your going
to be able to talk to somebody 100 + miles away little good that is going to
do when you need an ambulance or medical help.
see ya

I just purchased a Midland 29-790 and a Wilson 500 mag mount. The Wilson is getting to be a bit of a drag since I have to take it down at least 3 times a day and its scratching the paint.

My question: Could anyone recommend a luggage rack or similar type mount that would easily fold down. If so, any suggestions for an antenna as well? I have seen some mounts from Diamond, but I don't know if they fold or what to do about the antenna.

Thanks a Mil!

Paul Zook

Another token gesture aimed to pacify a small minded, CERTAIN segment of the amateur community who take it upon themselves to decide what should and shouldn't be sold. I have news for everyone. They are still on ebay. They will continue to be on ebay. They most likely will always remain on ebay. I have a confession.....There is a vast conspiracy among sellers of amps on ebay. We all keep moving the categories in which we place the amps to keep those hammies searching. This week, some are under "Electronics". Next week, they may be listed under "Garden Tools". The week after that, maybe, "Undergarments". The trick is to keep the hammies searching all of ebay, occupying the majority of their mundane time, to find these psychotics that are viciously pedaling evil amps..... and we continue take away their bandwidth due to infrequent use. Good job!

Uniden President HR 2600 w/Chipswitch installed. Recently aligned and gone over. Covers 24.800 to 29.999 AM/FM/SSB/CW with channel memories and programmable scanning, freq offsets and more. Comes with everything as it did when new including box and Chipswitch manual. Speaker output jack is now minijack, instead of that annoying nylon thing. $250.00 I accept PayPal or US Postal M/Os only. for an extra $50, I will throw in a Turner +2 desk mic and a older style (which was better) Cobra hand held power dynamic mic pre-wired, to go along with the stock up/down mic. Shipping extra.

try going to the Wilson 1000. you can take the coil off and leave the
magnet on the vehicle. Other then that check into the Hustler type
mounts for CB. They do have a fold over version that might just work
for you.

Nice post Dave!

It has been my personal experience that most of the E-Bay linear sales were
being made by licensed ham operators anyway!

Also look at who writes and distributes the peaks and tweaks books.

It has also been my experience that most, if not all, of the original linear
amplifier sales to CBrs were made by hams who were trying to get top dollar for
their old HF equipment so they could upgrade to 2 meter FM.

The source of the CB linear problem was 100% initially, and mostly (80%)
continues to be, directly attributable to licensed ham operators.

With that size amp you may run into problems depending on the radio, the stability level of the amp, the level of RF flowing on the outside of the coax shield (because of the mag-mount), common mode currents flowing through any ground loops, and the density of the RF field in which the radio and amp will have to work. Of the options you've provided, the Wilson on the roof will show higher field strength in almost all directions. If that's all you're concerned with, go that route. On the other hand, when running substantial power, the more forgiving (less likely to promote other problems) setup is a 102 inch whip and a spring with a true RF ground that is as far away from the radio and amp as is possible. The best side to mount it on is the high (drivers) side to increase the clearance between it and things that it might hit while you are driving. The long whip will show higher field strength in the direction of the most metal than the Wilson on the roof. In other words, with a corner mounted long whip, the radiation pattern becomes somewhat directional with highest field strength being in the opposite corner from where the antenna is mounted.

My personal preference always leans toward antennas with full metal contact RF grounds--especially when amps are involved. My advise is that since you've decided to go with a fairly serious amp, you should also go with an equally serious antenna setup. That would be a sturdy, solidly grounded mount on the roof (like a ball mount) and a specialized, high-performance antenna that is both resonant and a purely resistive 50 ohm load on the frequency where you operate the most (like a Stargun or even a helically wound whip like a Silver Load or a Broadstick).

A radio setup is only as good as its weakest link.

> it is on the money! Then it will talk some skip!!!!!

The above (about using the 259B) is the best thing
on this subject that I've heard.

The stock A-99 is NOT resonant and is NOT a purely
resistive 50 ohm load on CB frequencies. Given
those facts, you'd think it should have a high SWR--
but it doesn't. However, regardless of whether or
not it shows a high SWR, it can't be performing
optimally if it's reactive (not resonant) and not
50 ohms resistive. Any mod that brings it closer
to being resonant and a purely resistive 50 ohm
load is very likely to improve its performance.

The Firestick replacement top section is designed
to simply replace the stock top section while
maintaining the existing load parameters. In
other words, it's not designed to tune out the
reactance and bring the resistive component up to
50 ohms. At resonance a stock A-99 has a resistive
impedance of 27 ohms. The resonant frequency,
depending on the placement of the tuning rings, is
up near the start of the 10 meter ham band. The
SWR at resonance is about 1.6:1. The Firestick
replacement top section isn't likely to do much
since it's not designed to be electrically
different from the stock top section. On the
other hand, a longer top section may improve the
performance by lowering the resonant frequency
and increasing the resistive impedance component.
The problem is that to experiment in this area
requires more than an SWR meter. It's not un-
likely that the SWR at resonance using a longer
top section won't be 1:1. The idea is to make
the antenna resonant (inductive and capacitive

reactances equal and cancelled out leaving only
the resistive component) in the CB band, and
have the resistive component as close to 50 ohms
as possible. A longer top section, while possibly
improving the load parameters, will also increase
the antenna's physical wavelength. We all know
that 5/8 wavelength (about 21 feet as CB frequencies)
produces the lowest angle of radiation, which in
turn promotes the longest possible ground wave
(local) and long-haul skip range. Replacing the
6 foot top section with a 9 foot top secton brings
the overall antenna length to 21 feet.

With all of that, I'd say there's something to the
use of a 9 foot top section, but only if the load
parameters are at least as good as they are with
the stock top section. Chances are, the load
parameters won't be as good with the longer top section
as they are with the stock top section, so retuning
of the impedance matching section will be necessary.
The tuning rings are not likely to be enough, so
the bottom section will have to be cut open and
redesigned. That's not a job for a casual CBer.

In the end, we've come full circle. While it's
possible to turn the A-99 into a high performance
5/8 wave antenna, it's impractical for all but
the most serious antenna guys. For everyone else,
practicality dictates that we buy an antenna that's
closer to the ideal (21 feet long with a feedpoint
impedance of 50 ohms resistive) if that is what we
desire.

73 to all.

So even on flat land Tim 5-10 miles is the norm for a 5 watt VHF handheld.
Not one mile as you stated.

I am sorry to tell you Hams don't sell HF equipment to "upgrade" to FM. HF
to 2 meter is considered a down grade.

Not 20 years ago it wasn't!

It was what everyone wanted to do at that time.

No ham would be caught dead using HF AM.

It made all that HF equipment literally worthless and they could not even give it away.

And then along came the CBrs with no radio knowledge and thick wallets.

I used to hear hams on 2 meters, or on 20 meter SSB, (hardly any hams used 10 meters at that time), joking about how they got $400 more than the going rate for an old Heathkit SB200 with flat tubes in it simply by adding a footswitch and selling it to some dumb CB'r.

hi barry,
for your information a car battery will last a very very long time while cycling the car its in on and off for brief periods of time to keep it charged and a tank of gas can last quite some time doing this. the majority of emergency communications is a after the fact type thing. usually its just sending and recieving traffic to those in unaffected areas to reassure family members of those in the devastated areas. if you think a g5rv is too much of an antenna then outbacker and a couple others make nice tripod mount for there antennas that are perfect for situations like for this. 20 meters is usually the band of choice in the daytime while most of it goes to 40 meters at night. i agree with you that the emergency workers will be using vhf or uhf but they wont be on the ham band and unless you have a illegally modified ham radio you wont be able to talk with them directly. of course during a emergency all fcc rules are put on hold but who wants to pull out the soldering iron or whatever it takes to modify there HT after a big storm while theres likely to be a lot of flooding and other damage to you property.

>

Just what this NG needs is another human spell checker with way to much time on his hands! It is always the $6.50 per hour employees that come on NG's and make grammar and spelling corrections. In case you don't understand us busy professional people, we don't have the time like you to spell check our posts on NG's. We just type quick messages and move on with our lives! You will understand this better when you get the fortitude to move out of your mom's house.

P.S. Don't forget to fill the tampex in isle 9 tonight. 10-4?

A lot of stuff marketed to the public is hype. Back in the CB boom of the '70s, I saw an antenna that was all hype. It was a center-loaded design with a 2-3' lower mast. The brochure with it read: "Ever notice how your signals seem to get out better over water? Well, we have gone that one better. Inside the lower section is a liquid, except we didn't use water. We used a "secret" formula that is of a higher density than water to give you even <<better>> performance than being near a lake!" I don't know how many people believed that crap, nor how many people actually bought one of these things. But I laughed harder at that thing than at anything I could think of at that time. BTW, guess what the "secret" formula was? HA! Plain old vinegar! LOL! The old adage is still true: Let the buyer beware.

Sorry Barry most hams in tje USA arent that lucky to have towers there are many restrictions .. Most repeaters in my area are put up on water towers, and buildings etc that are owned by the municipalities because of thier great height 100+ And there is no way from a 50 watt mobile that i can hit these at 50 miles away. Unless some form of ducting is taking place...

Tim,

Barry is right. VHF is not quite as limited as you might think. A mobile VHF radio in simplex mode can usually talk for 10 miles, a hand held can be used for 4-5 miles especially if you get a better antenna instead of the rubber ducky. As to "modded" radios, this could be the answer to your comment AND a recent thread. The reason hams mod their radios is just for such a disaster. They (most of them) won't necessarily talk out of band as a general rule, but in an emergency it could be the difference between life and death. In my case, for example, I have a military spec VHF radio that does USAF AND civilian rescue freqs. Due to the relationship between the state of NC and the various Nat'l Guard agencies, I am authorized to operate/coordinate between the two. During Hurricane Floyd last year, I spent several days on the coast working in communications. The ability to work within both worlds really came in handy. As a clarification, I <<think>> that the FCC rules don't apply in a situation of "immediate" danger. But if you used a ham rig AFTER the danger had passed to pass ROUTINE traffic relating to logistics, personnel movements, and such, there might still be a problem. Not sure, but I <<think>> that's the way that works. I've been wrong before, OK?

That's odd,

They built and sailed the FIRST submarine to torpedo a ship! Name?
CSS Hunley.

<< The source of the CB linear problem was 100% initially, and mostly (80%) continues to be, directly attributable to licensed ham operators.

#12>>

Ah, Dennis, the ham-hater. Always an unkind word for the amateur. Must have deep scars from some incident involving a ham wayyyy back.

How else can you explain such flawed logic? If, as he claims, 80% of the eBay sales of CB linears are made by ham operators, then why did the eBay ban originate by the request of the ARRL (an organization consisting of hams)?

You would think all those hundreds of hams (80% of all the business according to Dennis)) devoted to selling CB linears would raise a stink with the ARRL and say "Hey ARRL, stop makin' trouble with eBay cuz we wanna sell linears to CBers".

But they don't because it just isn't so. You see a few hams selling linears to CBers and conclude that 80% of all linears are sold by hams? Sounds like deep seated prejudice to me....

Sincerely,
Aaron Voobner

In retrospect, you are probably more accurate in your appraisal of the situation than I was in the original post concerning auction of the 27 Mhz spectrum. There is an extension on the original rule until 2001 for spectrum auctions to take place. Even if it was heavily coveted, the gears on bureauratic (oops, Bureau-Rat : Freudian slippage here) progress could not be properly greased in time, especially with the higher prices for crude oil we are experiencing <G>.

Bravo.....

You may also have them add a few other terms to their alert list:

signal enhancement accessory
antenna efficiency improvement system
magnitude based signal processor
channel bandwidth widening device
frequency-specific electron concentrator
relief device for the benefit of the receive-sensitivity-impaired
electronic solution for magnitude-challenged communications

Actually we could suggest that the only way for them to be truly effective is to import the contents of their word processor spell checker database into their search engine to be sure of nailing all possibilities. That would offer a two-fold benefit. The would first have to determine what the hell just happened, and then who to contact to complain about it. That would keep their idle minds occupied and keep them from doing anything else "helpful" until they got a grasp on the situation. We could probably count on another generation passing before they remembered they had originally come to "drain the swamp".

That must be a sorry 50 watt radio you have Bill. I regularly talk to repeaters 50 miles away from my car on 50 watts. Especially if the repeater is on top of a building more than 100+ feet. For an example I regularly talk on a uhf repeater south of buffalo on 35 watts. I live west of toronto at least 50 miles as the crow flies. As for your statement that most hams don't have towers I would disagree with you.

I also talk on those channels from time to time myself. Some of the locals that have been on CB longest hang out there, and we all go way back..... Having said that, that still doesn't keep them from wiping out 4 or 5 channels either side of the operating channel with signals that are in the words of the immortal Shakespeare "Full of Sound and Fury; Signifying Nothing"; i.e., the semantic void I mentioned.

My math ain't great, but when you take away 2 channels from 40 you get 38. Then when you take away 3 channels on either side (I use 3 channels here in the essence of trying to be as forgiving as possible), you end up with 38 - 12, which comes up to 26. That is still a whole bunch, bunt not as many as my channel selector has numbers for.....

Again, the voice of reason emerges. Thanks Dennis, I have to agree.

I am one of the Ham community, but that doesn't mean I have to like or condone their activity. I got over the initial novelty of getting my license, (took nearly 8 years to do so), and I still enjoy 11 meters. It is a shame that there are so many "reformed CBers" among the ranks of the Amateur community trying to cover up what they left behind. That goes against the grain of self-actualization, so I guess they gave up on immortality and have just settled for hell on earth in their remaining days.

I personally have a few more important things to do before assuming room temp.

Barry,

As an experienced 50 Mhz and above weak signal operator, I am happy that you take this attitude. It has long been known that cream always floats to the top, and the true innovations of Ham Radio of late have mostly come from the ranks of VHF and above operators, not the fist pounders who covet the 7 MHz of spectrum known as HF. As long as certain elements consider 2 meters and above to be a down grade, we will continue to have use of spectrum on the order of 1 GHz of code-free spectrum to every 1KHz of the coveted wrist bender territory.

Please stay down where you belong with those who appreciate you the most. We will continue to advance the hobby with what we learn from exploring the new avenues of spectrum you consider to be a downgrade.

And some wonder why Ham Radio is on the decline. Thanks for presenting the answer so efficiently.

David

2914. Michigan Scanner Bill Dead?

Newsgroup: rec.radio.cb
Date: 2000-10-25 00:00:00 UTC
From: Jerry Oxendine <joxendi@bellsouth.net>
Message-ID: <39F77594.63F4@bellsouth.net>
Source record: 56849

Hey Guys,

I got this off another newsgroup. It's the first I've heard of this. Thought you'd like to know.

Michigan scanner bill gets Halloween-style stake through its heart: A legislative proposal in Michigan that would have regulated the possession of scanning receivers capable of receiving police frequencies has been killed. Michigan ARRL Section Manager Dick Mondro, W8FQT, reports that the bill's sponsor scuttled the measure in the wake of complaints from amateurs--even though hams were specifically excluded from the bill's provisions. The measure, House Bill 6012, would have made it illegal to have a receiver in a vehicle that received police frequencies. "The word to anyone inquiring is that the bill is dead, thanks to the collective efforts of those that care," he said. Bill sponsor Rep Mike Kowall was much more direct and colorful. "Rest assured that I have driven a stake through the heart of this bill, and it will never see the light of day and will die before it reaches the committee process," he said. Kowall said the bill was introduced at the request of the Oakland County Sheriff's Department. "The intent of the legislation was to allow police officers to obtain warrants for criminals in possession of a hand-held scanner," he said, adding that it was prompted by an increase in the number of criminals using the scanners to elude the police in the commission of a crime. "Amateur Radio operators play an integral role in emergency/management agencies, and their freedoms are guaranteed under the first amendment of the U S Constitution and should never be challenged," Kowall concluded.--Dick Mondro, W8FQT

With all due respect, David, the whole 25-30 MHz spectrum would not bring 27
cents from any professional user. Don't overestimate its importance in the
grand scheme of things.

Gore's math was fuzzy and Bush can't answer a direct question. They are both lame. Remember, the next president makes appointees to the supreme court, which has the distinct possibility of being "stacked" like never before.

Strikes me that a message is being sent. STAY BELOW 28. Making an opened-up rig unsaleable, making linears unsaleable, and generally costing bozos money is a far better and easier way than firing up the old kilowatt on 28.085 running 60 baud 850 shift RTTY and bracketing the truckers with an endless CQ. Listen to the BBC at 12.095 and see how long you can take the RTTY signal behind them. It isn't legally possible to interfere with a pirate but why the hell bother?

If this caper follows history from the Roman Army to the LAPD, undermanned enforcers all, the next step will be a public crucifixion or two to make the point more strongly to those who do not get the message the first time. A dealer in a previous thread expressed some well-founded reservations about getting into the business on just that basis. He has enough sense to ask which side he will be on before volunteering for the firing squad -- or a RICO action that will cost him every dollar he owns.

Will it get some of the more innocent? Crucifixions usually do.

The handwriting on the wall is perfectly legible: STAY BELOW 28.

Sure are a lot of "Dicks"among the amateur community.

This thread proves it.

When these "Dicks" were children they were probably the same
"Dicks" that use to tattle tale to mommy and then hide behind
mommies protective skirt.

The skirt now days is an amateur license. But a "Dick" is still a
"Dick".

Source record: 56864

OK, here is the deal. I am working on building my own vertical antenna, similar to commercial ones. With one snag, How do you connect the coax to the antenna? Yes just shoot me now! I want to be able to connect the coax to the antenna base, under the bottom of the antenna, but I don't know how. This is my first homemade antenna, and I haven't found a website that tells about how to connect the coax to the antenna. I read that I can't connect the coax directly to the antenna and that I needed an antenna matcher. But I haven't found any that I can use to connect to an antenna. Anyone with any ideas on where I can get what I need to make this connection?

I would also like to ask for some feedback on what I have planed for the design. I am planning on using 15' of 1/2" Copper pipe with a tapered end that will have a 7' steel whip w/ an adjustable set screw. This should give me a 5/8 wavelength. Near the base of the antenna will be a counterpoise, and a coil near the top of the copper portion of the antenna. Any thoughts or feeling from anyone experienced with antenna building on how well this will work, or suggestions on what would make it work better?

Thanks again for any help that can provide, you all help me to learn allot about CB and I just wanted to thank you again.

Maveric

Greetings!

Improvement?

Well, as the earlier posting said, it changes the "electrical properties" of the antenna.

A lot depends on terrain and how you plan to use the upgrade.

If the tip is a goner, then replacing it with a Firestik UP-99 might be a cheaper alternative than replacing the whole antenna.

Remember that it changes the properties of the antenna, it may or may not improve your stations performance in key areas that you might feel are important.

One thing that is mentioned - repeatedly in the page, is that the performance of what they did under field tests did change.

If you like the way the antenna is performing now, you shouldn't change the antennas top [I'm saying this to warn others] just for kicks. You might be wasting a lot of time and money - plus possible injury from a person trying to put it up and down all the time - and the wear and tear on the antenna itself.

If it works - don't fix it.

If it needs fixing, this may work but performance will change. How much depends on your expectations.

Greetings!

Radio stations your can can't pick up? [*chuckle*]

In a way yes, your car radio tunes into "Broadcast" bands, commercial stations.

Having a CB in your vehicle allows you to listen and talk to other people using a CB. The CB band is for public use, your Car radio listens to commercial-based radio stations designed to entertain and inform the public.

AM and SSB are modes of operation you can use to enjoy your CB as a means to communicate to other CB'ers.

Greetings!

Whoops, sent the message before it was complete...

To answer the radio types - both the 538W and 520XL are good AM only radios.

The 538 has weather, and does a pretty good job of picking it up, even in more remote locations. Front firing speaker, great for burying it into the dash or places that would normally block/muffle a speaker.

Straight CB radio - no frills.

Same for the 520XL...only to save space and is smaller - they mounted the speaker on the bottom panel. No weather.

Both have EXT speaker and PA functions [PA is regulated so be careful - check local laws].

I like the 538W for better handling of noise. Even though both have the same ANL and RF gain controls - the slimmer wider design of the 538W makes the knobs easier to use and the board inside a joy to work on versus the more compact 520XL - I don't think you'll be dissappointed.

Tim if you need a new tip any way then the the fire up 99 is the way to go...not that much difference in cost. as someone else said a steel whip will work but it need to be cut around 6 ft long and the added weight put more strain on the antenna....

The Wilson will beat the whip, hands down. Plan on buying replacement magnet and coax at least once a year, the power will slowly deteriorate something about it and they have to be replaced. (BTDT)

A few of us discussed placing a 102 inch whip atop an Antron here on the ng not too long ago. I've had several indications from separate folks locally that this improved their reception and/or transmit. As you say, terrain may play a part in this. Or it may be that swamp cabbage and 'shine.

I've heard that if you use the whip, use a MFJ 259B to tune it! Trim it until it is on the money! Then it will talk some skip!!!!!

Source record: 56733

NEWINGTON, CT, Oct 24, 2000--The FCC says it has reached an agreement with
the eBay auction site that's aimed at curtailing the sale of clearly
illegal radio equipment.

FCC Special Counsel for Amateur Radio Enforcement Riley Hollingsworth says eBay
has agreed to cooperate in removing advertisements in which the item for sale "is clearly
non-certified." Hollingsworth said most of the equipment involved falls into the CB
category, including illegal amplifiers.

"I've got a whole folder of people who have been complaining about this and will be
delighted to know that the Commission is taking action," said the ARRL Regulatory
Information Branch's John Hennessee, N1KB.

Hollingsworth said a review team within the Technical and Public Safety Division of the
FCC Enforcement Bureau is screening eBay ads each week. He said the practice could
be extended to other auction site if the FCC learns of similar problems.

Hollingsworth credits complaints from the Amateur Radio community with getting the
new system in place. "I've been collecting complaints for a year, but the amateur
community really generated it," he said. Hollingsworth says he sees about 10 complaints
a week about auction site advertisements--sometimes several about the same ad--and
has been forwarding all complaints he receives to a "duty team" within Technical and
Public Safety. He cautions that complaints should be based on clear-cut FCC rules
violations, however, such as attempts to sell illegal linear amplifiers.

"Amateurs can keep sending me items, addressed to fccham@fcc.gov," Hollingsworth
said.

It happened to be in Mobile, Al. The other city communications towers went down. The emergency communications center lost theirs. The only one standing after the worst was a ham's.

You STILL have this idea that it HAS to be a repeater. HF stations can run on LOW (QRP) power and get good communications. Hams DO have respectable towers. I currently live around 30 to 35 miles West of Washington, DC. There does happen to be several 150 foot to 200 foot towers owned by hams. .They aren't garbage ones either. Battery powered, low power HF radios, or even VHF can get the job done.

Police regularly use handheld radios that link with a repeater in the trunk of their patrol cars that relay out on the upper part of 30 Mhz.

Yes, I am a ham. I'm also a CBer. Both serve their purpose. Neither one is superior to the other. Nor is 2 meters the only way to communicate.

I wish I could remember EXACTLY which and whose tower it was. I was in Georgia on the other end of the HF link that ran the net control for a few days coordinating relief from the outside.

*
* Don't know where you got the 33% and 66% numbers.I have a couple 811A amps and
*DC input power is alway equal to RF out. This means they are running at 50%.
*Yes I push mine a bit beyound this too until I hear the distortion then back
*off and I know I am running at better than 50% when I do it. I also know the

*amp is not being run linearly anymore. A class B 811a amp runs about 50%
*efficent as long as it is with in its operating parameters no watter what the
*drive. So does every other B class tube amp I know of.. If you actually do get
*efficiency higher than 50% you are pushing the tubes beyond their linear region
*of operation. You can do this and get away with it but dont say this makes a
*linear amp 66% efficient, it is not operating linearly when you do this. It is
*also wrong to measure amp efficiency with a modulated signal. Should alway be
*CW. If you can understand what you are doing by using your own methods,fine,
*but expect the rest of the world to tell you that you wrong and don't complain
*when they do.
*
*Bottom line: If the efficiency of an amp changes with drive level then it is
*not linear.
****

my gosh this man has acheived nirvanna. AN amp with 100% efficiency. The output power is equal to the DC input power. Actually a class "B" amp will run between 50% and about 65% efficiency. The parameters that affect efficiency will be the determined if the tube(s) are grid driven or cathode driven, input and output component "Q", and the load in which the tube works into. Linearity is more based on the operating point at which the tube is biased and not entirely dependant on drive. The DC operating point is established with no drive. Aplying drive, and AC signal, will cause the DC operating point to vary up and down from the quiescent point. As long as the reproduction of the output waveform is linear multiplication of the input waveform then the tube amp is linear. Thus if the output power is an integer multiple of the input it is linear. if it were any other function, say the output is a square of the input, then the amp is not linear no matter how efficient the tube amp is. Efficiency is the amount of enrgy that is radiated as heat and not radiated out the antenna. Drive and proper matching along with bias affect efficiency. Of the three drive will have the most affect on linearity. excessive drive for a given bias point will create distortion. A distorted output is not linear.

2958. Re: What is antenna Gain ?

Newsgroup: rec.radio.cb
Date: 2000-10-25 02:35:15 UTC
From: fire228@my-deja.com
Message-ID: <8t5gt3akc1@nnrp1.deja.com>
Source record: 56741

Hamm4fun,

The book is not bad, it is good. It's not a matter of whether or not I believe what the book says, it's more a matter of my corroborating the information in the book by looking at the results of my own experience and experimentation. (Some of you reading this will realize that I am repeating myself here)

You wrote:

It should have said double the number of elements and qradruple the boom length. (Maybe you wouldn't mind letting us all know what your reference for this piece of information was.) If what you're saying is that you only have to double the # of elements AND quadruple the boom length to produce an increase of 3 db., I would have to say I think you're nuts. I would also say that you can't show me that in any credible book or article by anyone writing about antenna systems of this nature either. Not one.

You wrote:

Ever wonder why hi-gain arrays use Yagis and not Quads.

No, Ive never lost a lot of sleep over this one. The QUAD antenna is much more difficult to keep in the air. The Yagi design is not subject to the high wind load factors as is the QUAD. From reading elsewhere in this forum, some of you can't even erect an A-99 on a 30 foot tower without destroying the antenna.

You wrote:

The book gave the green light to selling 8 element antennas on short booms as of super antenna.
These are super antennas. I don't know what your definition of a short boom is, so take a look at this to see if we're even on the same page.

http://www.signalengineering.com/

If this is not a super antenna and the boom is too short, why aren't you building them the right way for us all? I don't know about any of the rest of you, but I think a 42 foot boom with 8 full-size full-wavelength loops is a fairly LONG.
(Not that it makes any difference except for comparison and/or

reference, but have you ever used something like this?)

You wrote:

I think most CBers can understand the theory.

Let me tell you something. I've met quite a few "CBers"
in the last 30 years and the majority of them don't care
about "theory". If I had a couple of bucks for every time
a customer told me...."I don't know nuthin' 'bout these
things, I jes' talk on 'em",....anyway, you get my point.
Some of you in this newsgroup involved in the business
end of this cb thing can surely confirm this for yourselves.

You wrote:

There are those that cant understand the math but they could
probably do the math if given the formulas and this is all that
other more advanced books do unless you get into text books.

Doing the math and using the formulas do nothing but allow you
to throw something together and get it on the air, if you're
lucky. You left out a few things though, like a whole new
glossary of terms with definitions that the hobbyist has to
familiarize himself with before he can even begin to understand
the underlying workings and principles involved. Let's not
forget about all of the basic background such as ohms law and
all of the other laws and foundational truths along the way.

Don't confuse being able to build one with understanding
how they work. The two hardly ever go hand-in-hand. Moreso,
the understanding is usually the last of the two to occur, with
a large lapse in between, if ever.

This all has to be grasped before anyone can understand any
of this, much less hold an intelligent and learned converation
with someone who has already established this "foundation" for
himself. The language is basic electricity/electronics. If you
don't learn the language, the secrets for you are hidden and the
truths you sometimes confuse for myth. Too bad.

I, for one. am thankful insomuch as if anything they might have
left out was any of the things you have postulated here, they were
necessarily ommitted. Orr and Cowan have forgotten more than you'll
ever know about this topic. No matter how much they may have had
to "demystify" all of this for the "simpler-minded", they did an
admirable job of explaining all of this to the technically
"unindoctrinated". No one can ever fault them for that. And you're
the last person in any position to critique these guys. If they
left too much out for your tastes, pick up some college-level texts
on the topic. I'm sure many of us here in this forum will welcome
your book report.

73,
NAO911/Jack

There is much hype in all marketing of CB products. You know, like
4 MRF-455 putting out 500 watts. If a manufacturer was honest about an
amps power rating for example, customers would not buy their amp and
would buy an amp that has a bigger number on the face! It is the
customer that eats up this type of marketing.

Your comment does not speak to the issue though! This is a manufacturer
that is NOT going to produce and market a product. If it worked they
would call it a fireup 2000 and the CB world would eat it up, even if it
improved nothing!

A 5/8 wave antenna gives you a lower angle of radiation thus further local contacts and more distant skip. IMAX doesn't have a groundplane kit available and besides a metal antenna with its gangly radials is less aesthetically pleasing than a nice straight antenna. if you become a ham, the 5/8 wave antenna also matches at 21 MHz - dual band antenna

What they do, as opposed to what they can do are two different issues. Customs officers can enforce all federal laws, and those of the province you are entering. Just because you have never been asked to produce you ham license is no reason to suggest that someone else leave theirs at home when they bring their equipment into Canada. The law does require that they have it, I suspect that that is the case in their home States as well.

.....I did NOT recommend leaving your license at home on a trip to Canada.
I merely implied that Canadian Customs (as a rule) simply isn't interested
in enforcing Industry Canada Rules any more then US Customs is in enforcing
FCC rules.
.....and you're right... the operator of a US amateur station is required
to have a license in his possession at his 'station' (..before the
nit-picking begins.. in the FCC's eyes, your station is where you are
operating from, be it a car, or your home), just as in Canada.

Oh wonderful. Just what I want my tax dollars being spent on. A "review team" to watch ebay for illegal cb amps.

>Hollingsworth credits complaints from the Amateur Radio community with
>getting the
>new system in place

Well done Amateur Radio community. If you will excause me now, I have to go make a donation to my local soup kitchen for the homeless because the government cant afford it since it has much higher priorities like "review teams" for private sales of cb amps. I hope you are proud of yourselves Amateur Radio community members.

2973. KEY DOWN school bus

I have been luckey enough to get a 30ft school bus, It has a brand new 390 ford moter in it, I am planning to turn it into a camper. But i would also like to use it for a key down mobile.So my question is what kind of antenna system should i use? I have seen some guys with all the sticks on top of there mobiles.I guess it is some kind of beam.I this is the system to use what are the measurements and how many elements should i use? I dont plan to run ac, just some 8 and 16 pill DC classes. Thanks for the info!

What it all boils down to is that so long as you use common sense and try to stay within the law, nobody is going to go ape on you and start inspecting your equipment to see if it's legal. However, be sure to have all your documents in order and in hand just in case you do run into trouble.

When you cross the border, you are going into a foreign country, but honestly, you are hard pressed to spot the difference. (Mind you, we are politer in most places and we have stronger beer!)

That's because it *IS* 19 on the highest band in a six band radio.
What happens is truckers don't want to get confused or are just lazy
and just flip the band switch on thier radios instead of changing
channels.

ok and ill say it again class b biasing is a resistor and a diode for each pill and perhaps a few caps here and there so lets see resistors are a few pennys diodes not much more add a relay for the rec amp and a transistor for the rec amp oh lets say $4-5 for that switchable ssb depends on how it is switched the addition of a dpdt switch and cap etc for the ssb delay another cheap item Lets assume $10-$15 in parts and i believe that to be on the high side compared to a $165 difference in the price of a comparable amp ..The math is not so fuzzy when it is spelled out in black and white ...

Copies is correct, thats all they are anyway that whole $539.00 amp has
about $175 in parts any monkey can be trained to build one ... Its just that
easy..

<joxendi@bellsouth.net> writes:

>Michigan scanner bill gets Halloween-style stake through its heart: A
>legislative proposal in Michigan that would have regulated the
>possession of scanning receivers capable of receiving police
>frequencies has been killed.

For now, but this bill will have more lives than a cat on steroids. Just like the anti-scanner legislation on the federal level, it will be reworded, repackaged, and introduced again and again until it passes. In the end, it will probably be attatched to some totally-unrelated piece of needed legislation, in order to assure passage.

The same government which ultimately wants to disarm it's citizens under the guise of "gun safety legislation" also wants to prohibit said citizens from having the means to monitor their activities. This is the real purpose here.

A quarter wave on a bumper has such a whacky radiation pattern I
wouldn't bother. Mind you, I'd punch a 3/4" hole in the roof of the cab
and mount something permanently - but I'm plum crazy that way..... :)

Source record: 56882

Hello. The problem you are having is called a "Bi Directional" Pattern. This is caused by using two antennas in series or as duals. Basically you are transmitting good forward and to the rear, but the sides are horrible. Try upgrading to one single good antenna, that should take care of it. A single antenna will give you back your " Omni directional" pattern. I have one of the new fiberglass K 40 antennas on my pickup, and love it! They have good power ratings and great performance. Should you need one, you can contact Glenn at: TheRadioGuy521@aol.com, he is a K 40 dealer in NY. I hope this helped!

You know your track record I have heard all about it from people who are in the keydown scene ... you worked for davemade for a short period of time ... left with his amp design and methods etc and went to chicago thinking you were going to be the man and started a line of amps that were duplicates of davemade with another backstabber who stabbed you in the back when Greed got the better part of you and him.. You then left chicago and tried to screw a few more people with the start of Nowatts .. In the end xforce and davemade are still going strong but you are on the back of the bus looking in ... All you are is a wannabe tech, any monkey can make a amp I guess you want some bananas.

First question , why are you using copper pipe ? 15 ft. of that is going to be packing some weight . Is this going to be up in the air some distance ? I would see if you can can get at least 2 different diameter lengths of aluminum , so it looks tapered , 3 would even be better .
Might as well make it so it uses ground radials , so you will have to build some sort of base to hold the radials and the center section together . The you get a SO-239 and attatch the center wire to the vertical aluminum section and the shield to the ground plane/base . You`ll have to check the impedances here , it may require a cap .

Just go buy a Solarcon 99 for 49 bucks and save a lot of headaches. IF you do decide to do this go to the library and get the ARRL antenna handbook .

Greetings!

At what height was the antenna when you get the 27 ohms impedance
measured?

We don't get readings that low here in Michigan.

Even with the ground skirt.

And people I've dealt with have their A-99's above the 30 foot mark.

On Wed, 25 Oct 2000 13:18:40 -0700, while the modem was pondering it's
navel, Bill Eitner <kd6tas@netzero.net> dissertated the following:

>Mobile 51 wrote:

3015. Is 500 Watts too much for a new truck?

Newsgroup: rec.radio.cb
Date: 2000-10-26 13:30:04 UTC
From: Scott <scott2rp789@netscape.net>
Message-ID: <39F831DB.9A14D9E2@grove.iup.edu>
Source record: 57000

I have a new 2000 Chevy Silverado and I was wondering if anybody knows if 500 watts might be too much for the truck. Will I have Check Engine Lights going on/off and weird things happening or not? I had a 100 watt amp in a 1990 Oldsmobile and I couldn't use the amp - it was causing strange things to happen.

Anybody run this or more power in a new Chevy?

Thanks,

Scott.

I don't think that was necessary. Richard McCollum usually makes posts that have some to offer and are realistic in their content. If you are referring to him as a troll, I fear you are barking up the wrong tree. There are others on the NG that are more deserving of your comments.

Scott,

FCC Rules Part 95/D RULE 10 states:

{A} Your CB station transmitter power output must not exceed the
following values under any conditions:

AM [Amplitude Modulation] - 4 watts carrier power [CP]
SSB [Single Side-Band] - 12 watts peak envelope power [PEP]
{B} If you need more information about the power rule, see Part
95/SubpartE. {C} Use of a transmitter which has carrier [CP] or
peak envelope power [PEP] in excess of that authorized voids your
authority to operate the station.

I currently have $28.00 in my 'thick wallet', and I need gas in the old '87 suburban, which requires more than that to fill it's tank.

> that is of course if you do not
> get laid off, ...cd is out........

No one is in good shape if they get laid off.

Luckily, if that happens to me, I'm so old that I can just retire with full benefits.

Then I can get a full time job driving a concrete truck and make more money than I ever did as an engineer!

As Hamm4fun already said, its the elements size compared the wave length that
give improved bandwidth at higher frequencies.

Scott.

I state facts and I automatically become a HAM-HATER.

If I said that 80% of the snowfall in Chicago would be in January and February, would that make me a snow hater?

I would just be stating a fact.

And the fact is : HAMS STARTED THE PROBLEM WITH CB LINEARS.

Accept it and go on with your life.

CONTEX/ABC was started by a HAM OPERATOR.

ASTRO was started by a HAM OPERATOR.

KRIS was started by a HAM OPERATOR.

HY-GAIN was started by a HAM OPERATOR.

FIREBIRD was started by a HAM OPERATOR.

MACO was started by someone who had a HAM OPERATOR partner.

D&A was started by 2 HAM OPERATORS.

PALOMAR was started by a HAM OPERATOR.

PRIDE was started by a HAM OPERATOR who was helping the handicapped.

Those are all folks who manufactured linears for use on the CB band that had built in keying circuits and were designed for full output with a 3 watt drive level.

I have only mentioned a few, and only ones who are no longer in business.

> How else can you explain such flawed logic?

Some HAM OPERATORS are so self-indulgent and enamored of themselves that they refuse to recognize the truth because it might tarnish their image.

Most ham operators accept the reality of the past and wish it hadn't happened,
and probably would do things differently if they could do it over again.

Just as most white folks now realize it was wrong to own slaves, and most
Germans realize it was wrong to kill Jews.

Notice I said MOST, because there are always a few who refuse to recognize the
truth and narrow-mindedly dispute the reality of what happened in the past.

> If, as he claims, 80% of the eBay
> sales of CB linears are made by ham operators, then why did the eBay ban
> originate by the request of the ARRL (an organization consisting of hams)?

Because the left hand does not know what the right hand is doing.

A better example of 'flawed logic' would be a ham operator petitioning the ARRL
or the FCC to allow them to sell illegal amplifiers to CBrs on E-BAY.

Those guys are much too smart to shoot themselves in the foot!

> You would think all those hundreds of hams (80% of all the business according
> to Dennis)) devoted to selling CB linears would raise a stink with the ARRL
> and say "Hey ARRL, stop makin' trouble with eBay cuz we wanna sell linears to
> CBers".

That would be 'flawed logic'.

As I said before, they are too smart to shoot themselves in the foot.

And I never said there were HUNDREDS of hams doing it.

If 10 folks are doing it and 8 of them are ham operators, that's 80%, right?

If 5 folks are doing it and 4 of them are hams, that's still 80%, right?

> But they don't because it just isn't so.

Man, you need to wake up and smell the coffee!

> You see a few hams selling linears to
> CBers and conclude that 80% of all linears are sold by hams?

All it takes is a few.

4 out of 5 to be exact.

> Sounds like deep seated prejudice to me....

Sounds like the voice of reality to me!

Read the details of the busts the FCC has made on the CB band in the last 5
years for running illegal power, jamming, etc..

The majority (I would say better than 80%) of them have been licensed ham
operators!

And many of them were EXTRA CLASS ticket holders.

Take off those Rose Colored Glasses and take a good look at the real world my friend!

I am not a 'HAM' HATER.

I am a 'NARROW MINDED PERSON WHO REFUSES TO ACCEPT THE REALITY OF THE SITUATION' HATER.

Feedpoint 15 feet above average terrain.

> We don't get readings that low here in Michigan.

You will at the resonant frequency (which isn't in the
CB band). In the CB band the resistive component is
higher, but there's a reactive component as well.

> Even with the ground skirt.

The A-99 isn't ground (Earth) dependant, and the ground
plane kit doesn't change the load parameters.

> And people I've dealt with have their A-99's above the 30 foot mark.

I know of another person who ran his with the feedpoint a
wavelength (36 feet) above average terrain and got the
same readings as I did at 15 feet. In fact, he's the
one who alerted me to the fact that the A-99 has a reactive
match. He shows up here every now and then, and used to
be here more than he is now. His name here is MC Turner.

The best thing about the A-99 is its consistency. As long
as none of it is within a quarter wavelength or so of any-
thing conductive, its load parameters don't change.

Obviously you have never used eBay. Go to "search". Enter "amplifier", "CB", "10 meter" or whatever you think appropriate. You will get back a list of CB amplifiers gleaned from all categories, no matter if they are listed in igarden tools or not, helpfully assembled on one page. This is how most people find things.

Someone is willing to give you $60 for an old 25... I've always
said that E-Bay was a seller's market.

You should do the CCAM mod and the T/R switch extra channel mod
to it before you ship it so the buyer will be getting something
decent for his money.

Cross-posted to: rec.radio.cb,rec.radio.scanner,rec.radio.swap

HAMFEST October 29, 2000 - Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST - October 29, 2000

LINDENHURST, LI - NY

On October 29, 2000 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic components, computers and access-ories, software, books, technical manuals, ARRL information, Amateur Radio License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are $20.00 each. Contact Walter Wenzel KA2RGI at 631 957-0218 for table reservations. NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space available.

General admission is $ 6.00. Wife's and children under 12 admitted with no charge.

VE - ARRL - 12:00 NOON at Babylon Town Hall, 200 E Sunrise Hwy, Lindenhurst. For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID),
and the examination fee, to the exam session. Current ARRL/VEC fee is $ 6.65,
exact change is appreciated.

Talk-in will be via GSBARC Repeater on 146.685 -600 136.5 PL.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 PM following the Newsline Report on the W2GSB repeater, 146.685 -600 136.5 PL required. You may also write to:

Great South Bay ARC
P.O. Box 1356
West Babylon, NY 11704

E-mail GSBARC info@gsbarc.org or visit GSBARC online at

3036. Re: Is 500 Watts too much for a new truck?

Newsgroup: rec.radio.cb
Date: 2000-10-26 18:46:00 UTC
From: Bill Eitner <kd6tas@netzero.net>
Message-ID: <39F87BE8.AA5AA1FA@netzero.net>
Source record: 57024

You should be okay as long as the power is radiated rather than flowing along the coax shield and through common mode ground loop paths. In simple terms, the installation and antenna choice are what will really answer your question. Here are some tips: Run the DC wires for both the radio and amp to the same places to avoid creating a ground loop. The opposite ends of the battery cables (the starter solenoid for the positive, and the engine block for the negative) are a good place to terminate the DC wires. Use a real ground (metal to metal contact) antenna. In the long run mag-mounts still screw up the paint, so suck it up and drill the holes. Run the coax with an eye toward trying to avoid things like computer boxes, wiring harnesses, and guage senders. Use an amp that has a halfway clean output signal and run it so the input signal sees a resistive load. That means at least one notch down from its highest output setting. Doing that usually doesn't lower the peak output much, but it does alot to clean up the output signal.

I hope this helps. Good luck and have fun.

This statement makes it sound like it was a decision made by and approved by the ham community. These people that you claim marketed amps to CBers (and happened to have a ham ticket) absolutely did NOT have the support of the majority of licensed amateurs behind them.

And the majority (via ARRL) is trying to do something about putting them out of business.

<>

So the ARRL knows that hams are to blame/are dealers for CB amps and is trying to cover it up? Conspiracy? LOL!!!

<>

Okay. Let's say there are 50 illegal CB amps sold on eBay per week. Do the math. It comes out to (by your flawed logic) HUNDREDS of Hams selling CB amps per year. HUNDREDS. Your numbers. Unrealistic? Yes. Skewed? Decidedly.

<>

Dennis, I think "thou protesteth too much".

Sincerely,
Aaron Voobner

Good tips, bill. For starters, the antenna will probably be a 6-7 foot whip mounted between the bed and cab. I am going to drip the mount in for sure. Also, to eliminate those common mode currents, I am wrapping a few turns of coax through a ferrite core at the feedpoint.

Scott.

I have used vertical dipoles on VHF successfully. I believe Antenna
Specialists made a bazooka style for firetrucks and vehicles without real
cabs that worked absolutely champishly. If they have mechanically solved
the difference between an 18 inch and 9 foot quarterwave and successfully
decoupled the beast (if it is weather sensitive, this may be questionable)
then I will be the first to stand, hat-in-hand, in awe and admiration.

Whatever else, get the poopsheet and RTFM.

Sideband: might Wilson have a site to view this bit of wonderment???

Agreed that 3/8" aluminum beats hell out of #18 bell wire and is a tad
shorter besides but don't expect miracles.

Thank you for the education on Yagis. Won't be the first time the writer
beat out the inventor. I think the only one who ever made a buck out of
race horses and color TV was a guy name of Annenberg with TV Guide and the
Daily Racing Form. He knew when to sell both.

Source record: 57037

The Wilson 4' no-ground "looks like" a J-Pole antenna (at least to the eye, I'm not sure what they did electrically, however). It is a 4 foot antenna with another approx 2' stub comming up vertcal right next to it, with a metal sliding matching clip connecting the 2. There is a seperate coax input at the bottom, you don't use the mount's input. They seem to outperform other "no ground" type antennas, and any length of cable can be used.

> most known and avaliable amp makers. they were all hams. coincidence? you
> decide for yourself.

That still does not get the CBer off the hook. Even a quick glance at Part 95 specifically states no external power amplifiers are permitted at any time, period. A CBer who buys one, and uses it, knows full well he/she is in violation of FCC rules. Just because amplifiers are for sale in no way implies it is legal for a CBer to buy, and use one on 11m. The simple fact is if the CBer did not use illegal amplifiers, both the CB, and Ham, operators would be much better off. CBer's can't ditch their share of the blame for the wide spread use of amplifiers, and modified equipment.

3051. Mastodon 5000 report

Newsgroup: rec.radio.cb
Date: 2000-10-26 19:54:29 UTC
From: Speedbuggy714 <galaxy1@zoomnet.net>
Message-ID: <700K5.23674$Xc.1194339@nntp2.onemain.com>
Source record: 57039

Recently I received a Mastodon 5000 5/8th Ground Plane that Jay is building. I was quite impressed as to the strength of the aluminum tubing and how it was assembled. Double clamping and double sleeved joints as well as all stainless hardware were included. The hardware on most aluminum antennas is Nickel Plated which will resist rust but not forever like stainless steel. The over all construction is just far better than any type ground plane of this style I have seen before. I have rebuilt and used many types of ground plane antennas in the past such as Penatrator 500 , Starduster (both new and old versions) Astro plane, CLR2, Sigma 2 and the 1/4 wave solid element "Droopy Drawer" ground plane , Antron , Imax 2000, Shakespeare big stick and the new army stick , Spectrum 1600 , Maco 5/8th as well as others. Jay's Mastodon 5000 beats them all on durability of construction and performance. The top hat is constructed in a very unique way and adds to the "cool" look of the antenna. Performance is what's important and this antenna sure has it. The cool looking top hat isn't there just for looks.

After putting the antenna up I checked it with an MFJ 259B antenna analyzer and the SWR was right on the money for the frequency I had Jay set it for. His assembly instructions for my desired frequency were perfect. It had a flat 1 SWR at the frequency I asked for in the 11 meter band. Not only did it have a perfect SWR but it also had a 50 ohm impedance and no reactance on the MFJ. You do not usually see this type of reading on a factory produced ground plane. They may have a good SWR but the impedance is way out of wack. Antron 99's usually run an impedance of around 27 ohms but still have a good SWR. This means your signal isn't being transferred as well as it should be and your transmitted signal is much less efficient.

The best ground plane I have ever found until this one was the original Penatrator 500 and the Sigma 2. Both these antennas perform very well but this new Mastodon 5000 beats them on received signal and transmitted signal reports. Locally (within 50 miles)I noticed an increase in received signal strength of 1 S unit over a like new Sigma 2. Local transmitted signal seemed to stay about the same. On distance (over 100 miles) the received signal came up 2 S units and the transmitted signal rose 2 S units. That is quite an improvement for just changing an antenna for the same type as was used before. Skip shooting is much improved with this Mastodon 5000 over a standard 5/8's ground plane.

Signal reports claim this antenna actually increased the audio quality as well. I found this hard to believe but that's what I was told by several players that didn't know I was testing a new antenna. Some have claimed the price for this antenna is steep but if you think about it, when you see how this antenna is constructed you will realize it's the last ground plane you will ever need to buy for the 11 meter (and more) band. When you think about that and the performance increase it offers, the price seems very reasonable. Also Jay is working on getting the price down even more.

The testing I did wasn't on an antenna range but all variables were controlled other than the atmosphere conditions. The test between a Sigma 2 and the Mastodon 5000 were done on the same radio at the same power level, same piece of coax, same tower at the same height (40 ft above ground) and within 1/2 hour of each other. It was good enough to convince me and I have tried a lot of ground planes in this manner. Both the Sigma 2 and Mastodon 5000 were matched at the antenna with the MFJ analyzer and then checked at the end of a 50 foot piece of LMR400 coax. No change was noticed on the analyzer. The Sigma 2 had a 42 ohm impedance where the Mastodon had a 50 ohm.

The Mastodon had good bandwidth as well. About the same as the Sigma 2 .

Without going into any more detail, I am quite impressed with Jay's new mastodon 5000 and to this date I have found nothing better in a ground plane antenna for 11 meters. By the way, it is easy to adjust for other bands of operation as well.

Great Job Jay! You know your antenna design!

Thanks for taking the time and spending the money on researching and building this great antenna. In these recent times where there isn't any quality new ground plane antennas to choose from you have came through with quite a choice. In my opinion, now, there is no choice. The Mastodon 5000 is the only one to choose if you want the best in performance in an Omni Directional CB antenna.

> per year. HUNDREDS. Your numbers. Unrealistic? Yes. Skewed? Decidedly.

What if those 50 amps were only sold by 5 people, and 4 of them were hams, and
those same people continue to sell like that for 52 weeks a year; that's still
only 4 hams.......

If they are not worried about breaking the law by selling amps to CBers, why
should they worry about the one amp sale per year limit the FCC places on HAM
operators.

Randy,
It depends entirely on when you want to spend the money
to buy new tubes. A 20% loss is ususally the point where
critical service users change tubes, but this is only
because they need to keep a constant level. For casual use,
it only depends on your wallet...

Just for the record, sir, I do not condone nor advocate what another chooses to do. My problem lies with the self appointed "cb" cops, who are just other ops. on other bands, and the majority of hams are not bothered by cbers. It is your attitude toward cbers that choose to ignore the law, not your opinion I find lacking merit.

I agree about drilling the holes. In the long run, you'll have better luck with the antenna performance. When you trade the truck in, just spring for a cheap CB antenna to replace the "good" one, and I'll bet you won't notice any difference in value. Maybe the new owner would appreciate having the antenna on there. I used to buy new cars and would install the HF antenna with a commercial grade ball mount (GASP!) I would remove the antenna and slap on a $10.00 shorty whip and leave it. With the proliferation of CBs and cell phones, no one seems to really pay that any attention.

i agree jerry. as i said before i gave you hard time at first but over these months its easy to tell you do mean well. i think the main problem is the newer ham operators stumble upon this group and think there going to change all our minds. they dont know some of these guys have been going at it longer than theyve been alive. myself, i've been dx'ing 11 meters since i was 12 and asking questions and learning as i go. i enjoy the group for the same reason as you. i just cant help it that i like assisting some of these rf policemen guys fit there foot in there mouth. because were cb'ers they assume we have no radio knowledge. it doesnt take the guys that think that way too long before they get showed up by somebody like toll free, dennis, peekaboo, or some of the others and they go away quitely to wherever they came from.

Message-ID: <39F8A741.4497@bellsouth.net>
Source record: 56955

Tim,

OK, OK, I'll come forward and make a statement. Are you ready? Are you sitting down? This is one of the funniest threads I have read! ROTFLMAO!

Anyway, I am NOT one of the hams that sells illegal amps. I have one mobile amp that I use--rarely. As you know, conditions sometimes are crappy on HF. As long as I can talk without it, I would actually rather do without it. But there ARE times..... Another time is when I get into a DX mood and hear a "rare" station I have never worked before. Chances are, there are lots of others who haven't worked that station, either. You know about "pileups", right? A mobile has little chance of getting in with 100 watts. That's when the amp comes on. When I confirm the DX station, it goes back off. So much for amps. I don't have an amp for the base. WAAL, I was almost tempted to buy a Collins 30L-1 at the Shelby hamfest last month. Good price for a Collins @ $500. Collins gear holds it's value, and when you buy it, you can get your money back and then some.

In spite of our own disagreements, I try to keep out of the amp flames on here because that is the only result--flames and hate. I don't even answer questions about amps. And I truly hope that the answers I do provide are taken in the spirit they are offered. You rarely see me involved in a running dispute with anyone. The other poster has to start it by really rubbing my fur backwards! LOL! Why do I come here? I come here because I LEARN stuff. I find out about products AND theories I can use in my own stations. So, if I benefit by what I read here, then why would I "bite" and snap at the newsgroup members that help me? You see, Tim, sure I am a ham and, unlike CD, I LOVE it. A main part of WHY I love it is the learning. It's like going to college all one's life except for attending classes. Each day I mess with radios, I learn some new thing. Each day I visit the newsgroups, I learn something that I can USE! I don't always post, but I often read something new here I wouldn't learn anywhere else. Like the HR2346 thing. I saw it here first. I HATE such a thing, and I immediately fired off a letter to my Congressional delegates expressing my opposition. The way I handle the amp stuff is just to keep quiet these days. We all know they are illegal for CB, so why stir the pot? Best for THIS ham to just leave it alone.

3071. Re: Antenna Coax connection

Newsgroup: rec.radio.cb
Date: 2000-10-26 21:53:33 UTC
From: 'Doc <w5lz@oio.net>
Message-ID: <39F8A7DD.5AA3C8C5@oio.net>
Source record: 56960

Maveric,
It's hard to recomend how to do this because it's going to depend on how you are constructing the antenna. You'd almost have to see how it's made.
A 5/8 wave antenna will need a bit of impedance matching to get it near 50 ohms. You can do this a couple of ways, and it just depends on how the antenna is made, one of them will be easier than the others (probably).
Any chance of seeing a picture/drawing of the base of the antenna?
'Doc

Stop kidding around... that 25LTD is an excellent unit and is far superior
to any Soundtracker type rig! It's been a very robust design that proved
itself for many years. Cobra finally admitted the SoundTracker/Weather was a
flop by coming out with the "new" version based on the "original" version.
How's that for confusing??? Unfortunately, the "original" version was still
better and had seperate controls. The latest copy from Cobra stacks the
controls (I hate that) to make room for the front mic plug. They goofed
again in my opinion...

Hi All,

Just an update to my pages, for those interested, I've added
another page for 30 addition CB radio Models. Go to:
http://home.att.net/~j.dow-kb2tlb/home.html/phfact.htm

Most of the listed CB Models in CB #10, and #11 are for
tube type and portables.

tnx,
jim/kb2tlb

Is this antenna not a beefed up model of the Penatrator 500, by beefed up i mean able to handle more watts and the aluminum is of a heavier grade, and far better construction than the others . If it is and this is not a knock on the antenna but if it is a close copy and a it is just a better constructed antenna how can it have this big advantage over the other good 5/8 waves out there on tx and rx ? I just dont understand how you are going to see 2 s units difference out of a comparable 22' antenna and 2 s units is 8-12 db improvement if a meter uses 4-6 db per s unit .. Again this is not a knock on the antenna it looks real nice but it also looks like a penetrator500 .. Can someone tell me what exactly it is that makes this big improvement in performance not just durablity I would like a technical reason there is nothing really different in this antenna for it to have that big a change compared to a another 5/8 wave...

If we broke it down to common sense a thing
a 1/4wave gp antenna compared to a 1/2 wave gp antenna, 3db is the best gain advantage that a 1/2 wave gp would have over the 1/4 wave gp It can never have a higher advantage than 3db but it could be lower. Next a 1/2 wave gp compared to a 5/8 gp well we know it wont be 3db since the antenna would have to double for 3db gain advantage. Ok The 5/8 will have a lower takeoff angle than the 1/4, or 1/2 but here you are comparing a similiar 5/8 to one of the best 5/8 wave antennas ever on the cb market the penetrator or the sigma. I just want to know what the breakthrough in tecnology is that the other antenna makers missed on the antenna test range. Again I am not knocking jay because he did do his work on the antenna and it looks mighty fine I just want to know what it is that makes this sucker get up and go. Is there a money back guarantee if i dont see 2 s units difference to the Penetrator on the roof ? I mean hell there are guys out here fixing amplifiers for life if you drop it out of the car hook it up backwards have your dog key up your radio with no antenna hooked up ... I am like Rogaine I want to know right Now !

I have stayed out of this for two good reasons: a) I don't know one way or the other, and b) too many aspects of illegality have been merged into one comment. Never attribute to conspiracy what can better be explained thru stupidity.

It would not be too surprising that amateurs as individuals were indeed among the early transgressors. At the time it was like marriage, combining maximum temptation with maximum opportunity. The AM wars were over on the ham bands and a lot of good gear, Johnson Vikings of several flavors, and assorted crap (remember the WRL Globe King?) that covered the old 11-meter ham band were unloaded on the CB crowd. All of the old ham gear had to come from hams; no doubt about it. The only thing surprising about that is that it seems not a lot of Collins KW1's made it to CB.

Even in 1960 it was pretty apparent that 4-5 watts would not cut it for the purpose intended which was, believe it or not, low-grade business applications. Any number of homebrew linears showed up, most built from salvaged TV sets for the most part. Sweep tubes are not among the best so 807s etc started to show up. In some cases, the CB drove an AM rig and was hi-level modulated. It was done, sure. Were some of them amateurs, no doubt; did the local TV man with a ham license help his friends, absolutely.

Then came the Fuel Crisis, Double Nickels and the whole pantheon of Convoy (C W McCall hated C&W BTW), Smokies, and everyone trying to sound like an Arkansan with an IQ not exceeding his belt size. Rebels Without a Clue abounded as they do today and on this newsgripe as well. And now it was time, as Dennis suggests, to unload the SB 200s and 220s with flat tubes and various other items from the garage rafters. No doubt he is correct.

But now comes the Japanese Invasion most notably the Yayhoo FT101 in several flavors with the infamous brown wire. At least one American manufacturer, Swan, took up selling its lo-end Cygnet slightly modified under the Sill(y)Tronics name. The amateur community, singularly or severally, had precisely zero to do with that. Sidebanders on CB and nearby freqs tend to be a bit more civilized and knowledgeable (and probably richer) bunch with better gear than the average Extra. The amateur community enjoyed the better prices volume gave and shut up a lot. There were, however, a lot of

clapped out FT101s unloaded on the untermenschen at remarkable prices even before EBay.

On the AM side came the 'footwarmers' that would cause anyone with any knowledge to barf.
Would not be too surprised if some of these came out of TV/CB shops back rooms when the repair biz was slow. Max dollar for min value was (and still is) the word when dealing with hobbyists and assorted groupies. Amateur involvement here was incidental. In fact the linear rules inconvenienced the living daylites out of amateurs with restrictions not caused by our criminal acts. It is probably here that the worm started to turn.

Of more recent years comes simple lunacy and more RWACs together with 'export' radios and opening up PLLs. By and large, the amateur community could care less (with the exception of the 'radio police' who do about as much for my digestion as yours). The appointment of Riley Hollingsworth as Special Counsel for AMATEUR Radio (emphasis mine) should if one has the intelligence God gave the average billygoat tell him that the emphasis will come in three parts.
First some housekeeping in the amateur service itself. Second, some leaning on commercial interests in amateur freqs. Third will be a defense of 28 MHz as the line beyond which freeband lunacy will not be permitted to go. The E-Bay linear campaign is simply a shot across the bow designed to let those with ears hear. At some point will come a few public crucifixions, more than likely of people making a buck on it.

Dick McCollum N0BK as in Beer Keg

From: kc2elo <kirk_mefford@my-deja.com>
Message-ID: <8tadeuatg1@nnrp1.deja.com>
Source record: 56971

Hey there radio cop. The original post never mentioned a thing about
CB. It could have been for a businessband radio or even a ham radio.

Now, captain obvious would say if he is in the cb group then it must be
for a cb, but also if it is for a cb and he is asking about power in
excess of the allowed output then he doesn't give a rat's ass about the
fcc rules.

You aren't accomplishing anything when you preach to an athiest, so go
bother someone who gives a shit.

I wouldn't touch a college level test with a 10 ft pole. I forgot all my calculus a long time ago.But most better antenna books do not require that kind of in depth pre requisite knowledge. It requires only a little more reading than what Orr and Gowan put in their book. I have heard way too much BS spouted on this NG because some one thaought that book was the sum of all antena knowledge and that anything that conflicted with it was false.What you say about the other books just is not so. The indepth theory is there if you want it but books like the ARRL Antenna book keep it pretty basic unless you want to get deeper. Then it is there if you want it. It least they tell how long to expect an antenna to be if it is to give the gain you would normally expect from that antenna. Obviouly you have not read or you would know that 48ft is too short for an 8 element antenna. Anyone who is buying one is just paying extra money for nothing. Six element on the same length boom would do as well.

I have no doubt about their expertises on the matter. Not familar with Gowan but Orr has written some excellent books both before and since this one. I just cant understand the difference.For example in his radio handbook he shows a 10dbd gain antenna that reqires 6 elements but to get 3 db more requires 15elements with logrythmic spacing. Yes this means at least 4 times as long. From the authors own book no less.

You are right , building an antenna has not that much to do with knowing how it works. You dont have to understand to build. Just follow the charts and instuctions.You will get a lot a basics down that were not covered in the book. Just the mental exercise of building one will help someone a lot and all this takes is some charts and graphs and you can build one with almost no caluculations and leave them with a lot more knowledge about what antennas wiil and will not do.

I never critiqued the writters and gave them their due credits several times. I have always felt that the editors had more to do with the way this book turned out than the writters and have said so. Of course this does not matter to you . You just say what you want. I know you will go back and pull out some reference where it sounded like I was talking about the authors. I made some and did not edit them all out though I tried.

3088. Re: Mastodon 5000 report

Newsgroup: rec.radio.cb
Date: 2000-10-26 23:36:14 UTC
From: Speedbuggy714 <galaxy1@zoomnet.net>
Message-ID: <7g3K5.23771$Xc.1216878@nntp2.onemain.com>
Source record: 56976

Good point Tim.
Jay has never stated, as far as I know, that the Mastodon 5000 will improve the transmitt or receive 2 S units over a Penatrator 500 or any other ground plane antenna. There for he isn't giving any guarantee to this fact. I bought one of the Mastodon's and that 2 S unit statement was mine and mine only. That was my observation and you may not have the same results. Conditions, Height, coax, impedance, SWR meter used, dirt on the antenna, oils from your fingers while assembling and near field objects can all effect the performance of an antenna. I am sure if you were not satisfied with the antenna, Jay would refund your money as long as it was a legitimate complaint but not because it didn't perform 2 S units above your other antenna.

The mastodon is a supped up version of the Penetrator 500 but it's not just in the structure that the improvement lies.

The matching network is also much improved. Not improved just to handle more power but is more efficient at getting more signal to the radiating element than the old Penatrator type system. You can also adjust the matching network for different frequency coverage easy. The old style didn't allow this without cutting and bending the matching network.

In my opinion (maybe not Jay's) the Mastodon 5000 isn't just made to transmitt and receive better than any other ground plane. It is the "Whole Ball Of Wax" better.

Better strength, Longer lasting, handle's more power, better looking, easy to adjust for SWR, as well as a better performing. (a good bit in my book)

If you only want an antenna for 6 months, and you don't care what it looks like, and you only talk on 1 channel, and you don't run much power, and you are not concerned about the wind or ice damaging it and having to repair it then the Mastodon 5000 is not for you.

Personally I would like to put it up, get it all set and never have to worry about it for another 20 years no matter how much power I choose to run through it. That is why I use 20 year coax, all stainless hardware on my tower, seal all the joints on the antenna elements as well as the coax connections and use Rohn type tower. It should be good for 20 years or more.

By the way , Jay does not give a 20 year warranty on his antennas either.

Mike

Bob, thank you for pointing out the patently obvious US law and blindly assuming that the entire world is in the USofA. That aside, the original poster probably won't have any problem running 500Watts in the truck. The other posters comments on permanently mounting the antenna are sound advice and concur with them wholeheartedly. Now Bob, enjoy your CB radio. When the skip rolls in and the noise floor comes up, you'll be talking to yourself while I'm talking to other continents. Have a nice day.

MC

When approaching the customs office at the Canadian border they will ask
you one question:
Q: Citizenship?
(Answer this question in the following manner)
A: Goddamit, I am an American! I have no guns under my back seat, there
isn't some guy named Kwong in my trunk and I haven't swallowed any
condoms full of cocaine!

I think its safe to say that illegally modified radios will be the last
thing on the customs officer's mind after this. The downside is that
they will probably probe your anus with a very large a drumstick.

Enjoy your stay in Canada.

Newsgroup: rec.radio.cb
Date: 2000-10-27 00:19:25 UTC
From: CodysPC@Iserve.Net
Message-ID: <39f8c7f1.618183@news.iserv.net>
Source record: 56981

Greetings!

Thanks Bill, I'll pass this info along to the guys that were asking similar questions - I'll give them the results and ask for them to check it out.

In case you were wondering, we got 36~38 ohms impedance with a regular A-99 without the GPK - at 36' with grounded guying.

The other I helped install, it's reading was about 32 ohms - and fluctuated, which we considered to be due to a tree nearby the antenna. This one did have the GPK and was 45' above ground.

Both resulted in a dead-nuts match 1:1 SWR on all 40 - after tuning rings. [Which is why I haven't seen the resonate - but it's close to a typical S/S or Fiberglass whip for 1/4 wave on a mobile.]

Attempting the change over is what they are asking - and I hope to be there when they swap the tops. I'll tell them what we got out here and see if they'll bite for the change and observe the results.

I'll post results from their tests, hopefully soon.

But something tells me though, that the "overall benefit" might not be a good as some people may claim. We'll just have to see...

Thanks!

Just make sure it is well grounded, and the SWR is as low as possible. The computers in the newer cars and trucks can get cranky if RF gets into them.

Bolt the antenna firmly to the truck. Stay away from bumper mounted whips unless you want a crappy radiation pattern.

B-Squared

3098. Joke Of The Day.

Newsgroup: rec.radio.cb
Date: 2000-10-27 00:29:45 UTC
From: scsiudma@aol.com
Message-ID: <20001026202945.19083.00001180@ng-mk1.aol.com>
Source record: 56985

Little Johnny was sitting on a park bench munching on one candy bar after another. After the 6th one a man on the bench across from him said, "Son, you know eating all that candy isn't good for you. It will give you acne, rot your teeth, make you fat."

Little Johnny replied, "My grandfather lived to be 107 years old."

The man asked, "Did your grandfather eat 6 candy bars at a time?"

Little Johnny answered, "No, he minded his own fucking business!"

3099. Re: Where is Joe Gunn

Yes but on voice modulation it represents only about 10% of the total power.
With 100% Sine wave modualation the amount added when audio is present is only
33% of the total. Whether the signal is modulated or not will have little to do
with the efficency of a linear amp amplifying a voice modulated AM signal.

Neat trick, How can you get a 1:1 SWR if the impedance of the antenna is 32
ohms. Only way I know you can do that is have a 32 ohm coax.

hi,
i'm getting ready to wire up a turner +2 to my 840 but i have a question.
can i just wire it straight or not? i'm worried about the difference in
impedance. the turner is somewhere around 6000 ohms while the yaesu is some
where around 600. i dont have paper work with excact figures but thats close.
maybe some of the hams like dave, doc, or hamm4fun will know a little more.

>antenna will probably be a 6-7 foot whip
>mounted between the bed and cab.

This can be a problem when running power.
1.Your bed sits on bushings little or no ground = screwing with electronics
2.The antenna being right behind the cab can reflect and/or give poor groundplane effect.
I recommend a Wilson 5000 base load roof mount. Although I dislike agreeing with Bill, but he's right, suck it up and drill the hole.

<<Also, to eliminate those common mode currents, I am wrapping a few turns of coax through a ferrite core at the feedpoint.>>

I'm not sure this is a good idea either, check with Dennis O. on that one. Run the roof mount, run 6ga wire hot and ground to power your box, and 8-6ga wire from case of box to frame (short). Again, as Bill said, if it's a decent quality box, you should be good to go.

Source record: 56906

I have a new 2000 Chevy Silverado and I was wondering if anybody knows if 500 watts might be too much for the truck. Will I have Check Engine Lights going on/off and weird things happening or not? I had a 100 watt amp in a 1990 Oldsmobile and I couldn't use the amp - it was causing strange things to happen.

Anybody run this or more power in a new Chevy?

Thanks,

Scott.

I have heard a person run up to 1000 watts swing out of 2000 GMC. They had two power window motors burn from excessive RF. The individual had to drop key to less than 50 watts to solve it. They were using a Wilson 5K drilled thru roof at rear, well grounded. The new GM vehicles are wired very flimsy compared to models 98 and 99.
Grounds from factory are poor, stereo wiring is cheap. It is very easy to pick up RF in the factory wiring that previous models ignored. You can't ground it well enough.

3119. AB Linears

Newsgroup: rec.radio.cb

As far as I know, and linears for CB are Class AB, now, can anyone go to a Ham radio shop and buy a Class AB linear from them, and use on CB? Would it work, or does the amp has to be AB specifically made for CB?

This is not true, from the factory, the cab and bed are connected to the
frame in multiple places with #2 AWG wire. Even the exhaust system is
tied to the frame. Prevents accelerated corrosion on certain spots on
the vehicle.

<<Also, to eliminate those common mode currents, I am wrapping a few
turns of

> big a change compared to a another 5/8 wave...

Maybe I misread his post, but I thought that even though he mentioned a penetrator 500, the actual comparison was Jay's Mastodon 5000 antenna VS a Sigma 2.

Against a Sigma 2 I can believe some of those numbers.

I don't believe there would have been that big a difference if the comparison was to a properly assembled penetrator 500.

Lots of metal at the feedpoint, where the antenna current is the highest, can make a difference.

Jay likes thick metal parts and clamps that have little or no resistance.

The Penetrator 500 was always my choice for a base antenna till they stopped making it, and I would rather pay $200 for a used Penetrator than $50 for a new Sigma 2 because of the great luck I have had with the Penetrators.

Unfortunately they don't make them any more because of idiots who like to hold them while touching power lines and next of kin who like to sue a company for not making their product idiot proof.

Jay was trying to resurrect the Penetrator and just didn't know when to stop improving his product!

: Making the top section a little longer helps. To get my Antron to tune on CB I
: had to run the rings all the way to one end(bottom I think). Replaced the
: factory whip with a 102 inch whip and set the rings to the middle and trimed
: the whip for lowest SWR in the middle of the CB band. Results were a lower SWR
: and possibly a slight improvement on receive would not even hazzard a guess on
: transmit. The Antron works better on 10m than 11m as it comes out of the box.
: Lengthening the whip optimizes it for 11m.

Having the lowest SWR does not necessarily mean that the antenna is radiating the most power that is possible. This would only be true if the antenna was designed to be an rf 50 ohms impedance at resonace - at the mounting height at which the antenna was placed.

You might actually radiate more power if the SWR was NOT close to a 1:1 match.

Hamm4fun,

You wrote:

I have heard way too much BS spouted on this NG
because some one thaought that book was the sum
of all antena knowledge and that anything that
conflicted with it was false.

You didn't hear it from me.

You wrote:

Obviouly you have not read or you would know
that 48ft is too short for an 8 element antenna.

Multi-element monoband and multi-band arrays
are often built both commercially and by individuals
using element spacings from .12 to .25 wavelength.

For an 8 element quad on a 42 foot boom, that
leaves about 5.2 feet between elements if all
are spaced equally. that equates to .14 wavelength
spacing between elements. Someone obviously isn't
"read" but it isn't me.

You wrote:

For example in his radio handbook he shows a 10dbd
gain antenna that reqires 6 elements but to get 3 db
more requires 15elements with logrythmic spacing.
Yes this means at least 4 times as long.

The antenna that he talks about here is not your
run-of-the-mill yagi. Your inability to point this
out is somewhat confusing. The design he was
referring to here is a log-periodic array. Let's
keep the apples in one basket and the oranges in the
other. (logarithmic)

log�a�rithm (l�g-rthm, lg-)
n. Mathematics

The power to which a base, usually 10, must be
raised to produce a given number. If nx = a, the
logarithm of a, with n as the base, is x; symbolically,
logn a = x. For example, 103 = 1,000; therefore,
log10 1,000 = 3. The kinds most often used are the

common logarithm and the natural logarithm.

Some links for information on log-periodic arrays.

Well here is the official stand on that question.

Part 97 is the hamateur bible for those who didn't know.

Sec. 97.317 Standards for certification of external RF power amplifiers.

(a) To receive a grant of certification, the amplifier must satisfy the spurious emission standards of Sec. 97.307(d) or (e) of this part, as applicable, when the amplifier is:
(1) Operated at its full output power;
(2) Placed in the ``standby'' or ``off'' positions, but still connected to the transmitter; and
(3) Driven with at least 50 W mean RF input power (unless higher drive level is specified.)
(b) To receive a grant of certification, the amplifier must not be capable of operation on any frequency or frequencies between 24 MHz and 35 MHz. The amplifier will be deemed incapable of such operation if it:
(1) Exhibits no more than 6 dB gain between 24 MHz and 26 MHz and between 28 MHz and 35 MHz. (This gain will be determined by the ratio of the input RF driving signal (mean power measurement) to the mean RF output power of the amplifier); and
(2) Exhibits no amplification (0 dB gain) between 26 MHz and 28 MHz.
(c) Certification may be denied when denial would prevent the use of these amplifiers in services other than the amateur service. The following features will result in dismissal or denial of an application for certification:
(1) Any accessible wiring which, when altered, would permit operation of the amplifier in a manner contrary to the FCC Rules;
(2) Circuit boards or similar circuitry to facilitate the addition of components to change the amplifier's operating characteristics in a manner contrary to the FCC Rules;
(3) Instructions for operation or modification of the amplifier in a manner contrary to FCC Rules;
(4) Any internal or external controls or adjustments to facilitate operation of the amplifier in a manner contrary to the FCC Rules;
(5) Any internal RF sensing circuitry or any external switch, the purpose of which is to place the amplifier in the transmit mode;
(6) The incorporation of more gain in the amplifier than is necessary to operate in the amateur service; for purposes of this paragraph, the amplifier must:
(i) Not be capable of achieving designed output power when driven with less than 50 W mean RF input power;
(ii) Not be capable of amplifying the input RF driving signal by more than 15 dB, unless the amplifier has a designed transmitter power of less than 1.5 kW (in such a case, gain must be reduced by the same

number of dB as the transmitter power relationship to 1.5 kW; This gain limitation is determined by the ratio of the input RF driving signal to the RF output power of the amplifier where both signals are expressed in peak envelope power or mean power);
(iii) Not exhibit more gain than permitted by paragraph (c)(6)(ii) of this section when driven by an RF input signal of less than 50 W mean power; and
(iv) Be capable of sustained operation at its designed power level;
(7) Any attenuation in the input of the amplifier which, when removed or modified, would permit the amplifier to function at its designed transmitter power when driven by an RF frequency input signal of less than 50 W mean power; or
(8) Any other features designed to facilitate operation in a telecommunication service other than the Amateur Radio Services, such as the Citizens Band (CB) Radio Service.

Addendum/Correction

For an 8 element quad on a 42 foot boom, that
leaves about 6.0 feet between elements if all
are spaced equally. that equates to .16 wavelength
spacing between elements. Someone obviously isn't
"read" but it isn't me.

Can't never proofread too many times........

Jack

3134. Opinion on setup before I buy

Newsgroup: rec.radio.cb
Date: 2000-10-27 04:49:28 UTC
From: Aaron Mooney <aamooney@vt.edu>
Message-ID: <8tb19dbte1@solaris.cc.vt.edu>

I am about to buy a Uniden Pro 520 XL and a Cobra AT 35 antenna. Are these products any good? If not, what would you suggest for a small radio and a magnetic mount antenna for a compact car?

Thanks,

Aaron

3135. Re: Antenna Coax connection

Maveric,

If you use (Plumbers Delight) direct dc ground
shunt type feeding system, (gamma match, beta match)
you can simply take a piece of angle/bracket aluminum
and mount an SO-239 connector into a 5/8" hole at one
end of the bracket and attach the other end to the
antenna. If you're really sharp (and imaginative)
you can mount the SO-239 right inside the bottom of
the main radiator element also. Pictures are nice
but some metal fabrication and machining experience
comes in handy here too. To help "see" all of this
it is sometimes helpful to draw the antenna
"circuit". I strongly recommend teflon as your
insulating dielectric material, not cheap polystyrene
or plastic.

UnidenPC66XL or PC68XL for the radio.
Wilson 500 or Wilson 1000 for the antenna.
The few extra bucks you spend will be well worth it.

Tomm Hutt,

Regardless as to whether or not you already own 1
of each of these antennas,(102 whip, Wilson 5000 mm)
what you really need is a wider selection to choose
from.

cab roof center/rear center mount, no magnets

Try the QS 564 Quad Wrap by PowerStik....5 1/2 foot
or the 83" Solarcon ThunderBolt. Frequency coverage
within tolerable swr limits are 150 - 200 channels
and 250 - 400 channels, respectively.

The Uniden is a good radio (could be better, but for the name, its ok).
the antenna? hmmm, lots of variability there.

depends on the range and performance Vs. appearance considerations....

3144. FS: Nearly New Blue Face Galaxy 250 amp. 2 x 2290's.

Newsgroup: rec.radio.cb
Date: 2000-10-27 05:52:49 UTC
From: tobymills@sansspam.earthlink.net
Message-ID: <39f91096.120358798@news.earthlink.net>
Source record: 56932

I have the following amp for sale.

Blue face Galaxy 250. $120 + shipping.

2 x 2290's for the pills. 20 amp fuse.

Nice clean little amp with 3 power levels and a recieve pre-amp.
works on SSB as well as AM for those of you who like to talk there.

This amp has only been used for about 10 hours in it's life and I
bought it about 2 months ago while on the road for $195 (live and
learn). It seems sort of hard to find this amp on the internet - I
see other 2 pills, but not with 2290's. I found that TX star makes
one.

I was driving it with my cobra 29 and Ranger RG99 both with the
deadkey turned down to 3 watts. I saw it swing to about 200 watts.
Never really saw it get the full 250 as advertised on the face plate.
I ran it at about 13.8 volts. My SWR is always 1.4 or better. No
warranty that I know of, but it's working great for me.

Everybody seems to like it that I talk to with it. One guy was
driving away from me and when he said I was getting a little faint
(without, I turned it on the medium setting and asked if that helped.
His response: "sounds like you just walked right in and sat down next
to me!".

Presently it's got about 10 feet of 10ga wire crimped to it with 3/8"
eyelet ends to hook on you battery terminals.

Email if interested. Remove the sansspam part from my earthlink
address.

-Toby (who's liking his new x-force 4 pill)

Hello Wild Bill: These are some pretty good questions Bill. Hope I can answer them satisfactory for you.

After looking at all the CB, Ham, and Commercial Antennas I saw that the Hy-Gain and other manufactures method of using a two point mount (to support the vertical element) was far superior than all the rest. Their older designs had a single point mount for the vertical radiator, they stopped the production of these antennas, and went to the two point mount. I simply changed the design a little and made them out of heavier material. And yes it looks like a Penetrator.

To answer your question on different antennas in field strength tests, I will tell you that different antennas will show different field strengths in different installations and locations. Also that as the a antenna is installed, the reflecting energy from the ground will (big time) effect the antennas pattern. Mike did the antenna comparison tests correctly, he used the same coax, tower, and antenna height. His tests basically agree with my field strength tests. The two antennas are not the same lengths, and are not feed the same way. But are close in the basic amount of length vs wavelength. Its possible the upper elevation lobe around 42 degree's is stronger that than the one on the Sigma 2, and this can explain the difference in the DX signal strengths.

The two antennas in comparison are very close. But the Mastodon uses a inductive input and output impedance matching system that has a few less dB insertion loss than do all the rest of the antenna impedance matching systems. Instead of being made of 14 or 12 gauge wire its made from 3/8" aluminum rod, and 1/2" aluminum tubing. I have compared the old Hy-Gain Penetrator 500 to the Mastodon 5000, and have measured 2 to 3 dB and more in field strength from the Mastodon, due to the lower loss in the impedance matching systems. So the physical antennas are close to each other in lengths, but not in loss's in the impedance matching devices.

The antenna gain figure of the antenna is always a big thing, that gets a lot of attention. I say the Mastodon 5000 has 1.2 dBd or 3.3dBi gain. The other manufactures said their antennas had a 5.1 dB gain, but did not say what their dB gain rating was compared to. But the Mastodon 5000 beat these antennas in local field strength tests. The 64 dollar question here is, did the other manufactures base their dB gain figures on a computer generated figure (that did not probably consider the impedance matching loss's) or actual range measurements? Did some antenna manufactures dB gain rating come from the advertising department instead of the engineering departments? The dB gain figures are sometimes a waste of time. If a good antenna is installed low and has a lot of loss in the coax, and the old lady hangs the laundry on the

antenna, it ain't gonna work. But if you install the antenna high, and
its impedance matching device has a minumin loss to it, your gonna hum
in antenna performance.

An amateur can't go to the Ham Store and buy an amp that will work on 10-11
meters out of the box; why should you be able to?

Thanks gang.

It was noted on one of the ham groups this morning and on this group previously that the only amateurs who really give a hoot are the newer ones.

Being one of the very few who ever used 11 meters when it was a ham band (mildly illegally but WTH) I find it mildly ironic that the best friends you have in the amateur community are us geriatric old farts (if 56 is an old fart) that keep being accused of holding out to the last man for code tests.

Get your act sorted out, gang.

Tim - It will work just fine. The only possible difference will be a shift in tonal qualities, and perhaps a slightly lower performance.

For #12 - What precisely should he build as a quick and dirty impedance match?

B-Squared

Do your self a favor and get a Uniden Grant XL and the Wilson 5000. You won't regret it. It is great setup for the money. Expect to pay about $120-$150 for the radio (am, U & L SSB 40 ch) and about $80 for the Wilson 5000. This maybe more than you were wanting to spend but the setup can't be beat in my mind for the price.

You can introduce some strange impedance problems with the core. Just make
sure the coax is a resonant length. N-type connectors are better for smooth
impedances. SO-239s and PL-259s cause an impedance "bump" at their
connection.

I wouldn't mount it between the cab and bed, but either on the roof or on a
well grounded toolbox in the bed.

No a 2x4 has about $200 in parts that would be the ssb one including preamp and bias etc... How many would you like .. Why dont you think anyone could build one much less a monkey if you know how to solder you can build an amp or duplicate them just like 123 did ... do you think he designed them hell no, nether did the guys a xforce he was a solder jockey why is this so hard to understand...

4x 2879's $60
2x2290-$25.00
chassis $25.00
fan $5.00
2- so239's $2.50
heatsink -$12.00
variable knob- $5.00
circuit board $5.00
relay - $3.00
input /output transformers- $17.50
wire,resistors,caps - $25.00
screws for chassis $2.50
thats a total of $184.50 did I leave any parts out?? still under $200 buxs

SCOTT, THE FOLLOWING POST IS FORM FIRESTIK AND IS FOR YOU! THE ABOVE WORDS (YOURS). ARE FOR YOUR PERSONAL CONSUMPTION. EAT THEM!

Thanks for the message. On our test site, the radiator on the IMAX had a center frequency of 28.00MHz at 1.1:1 SWR @ 37 ohms. The straight wire design allowed for wide bandwidth (26.170 to 30.800 with sub 2.0:1 swr). As with the A99, one of the primary advantage of a helical radiator is the lowering of the radiation angle. We've played around with the IMAX and found we could successfully use a 5 ft, 6 ft or 7 ft radiator and get improved ground wave propagation as well as a lower background noise. What we haven't done yet is pour power through the antenna. Helicals get
a good voltage boost because of the top coil design and that means extra heat needs to be dissipated. The IMAX is rated at 5 kW and all we have is a 1 kW test amp. We are suppose to do some 1 kW power test in the near future but I don't know what will be done for a 5 kW test.
I suspect that the majority of the IMAX's are used below 100 watts but we still need to establish some guidelines. We have been dealing with the inquiries on a one-on-one basis and when we can establish the stations power, we can recommend a helical.

It is great to hear user success stories and I will keep your message in our "testimonial" folder to help our technicians make recommendations to inquiring end users. Perhaps we will add an IMAX upgrade sometime next year after some power tests can be completed.

Thanks again.

Todd wrote:

Greetings and Salutations! After seeing your add for A99 firestik upgrade. I toke an old 5' firestik II I had,removed the screw and put it on my I-MAX 2000. After doing so I couldn't believe how much better my antenna worked. I had wider bandwidth and better power dissipation across the band. I'm a licensed ham. So I'm always looking for ways to improve my systems performance and save money doing it. Between 25.165 to 28 Mhz my swr is 1.1:1. HONESTLY. This set up is great for 11 meters. It's amazing how many more stations I hear and can contact now with this firestik upgrade. I have used Firestik products for years and will continue to do so. Thanx for a great product. Why do you advertise the upgrade for the A99, but not the

I-MAX 2000? I look forward to your reply.

that set-up is ok, and if you've never heard better you will think its good..... the 520 will be a bit noisy on receive because it soesn't have the filters that the better rigs have. but like PEEKABOO said. you can do alot better for just a few bucks. the 68, 78 and grant are excellent radios.

Greetings!

Remember those threads about "SWR" detection - using the MFJ is about the slickest thing to determine actual resonace versus SWR for coax losses and other none-such TVI/RFI problems resulting from it.

SWR metering and the detection methods used in a typical SWR meter do not always equate to 50 ohm impedance because the voltage drop across the diodes leaves enough margin of error that what may be perfect on an SWR meter is not enough for "picky" people. Using the MFJ-259B demonstrates this - as per Bill E. has also experienced.

It is by the MFJ - versus a typical SWR meter, is how these readings were obtained. Compared to both - the MFJ can show a lower than expected impedance - even though the SWR side is a perfect 1:1.

The "dead-nuts" comment was to let others know what the reflected SWR readings on a typical SWR meter showed a perfect 1:1.

As far as actual RF resistance, I take it with a grain of salt. A lot of it has to do with height and how the ground effects and near field objects play with the antenna and it's own physical length. The addition of a ground skirt and it's effect in the impedance can be seen on the MFJ. I wanted to clarify this with Bill and I've got the answer I need, 15 feet.

As far as my original comment, I stand by the fact that if it works - you still don't need to fix it. Some that mentioned this in our little circle here in Michigan - need a little goading to see if these other tips can do what Manufacturers say they do.

I wouldn't want to climb up on the roof or a tower just to see if changing the tip was worth the hassle - and they feel the same way - and I respect that.

> the truth.

I gave up on CB over 25 years ago when the local channel control freaks, noise makers, jammers, and amplifiers started showing up big time on the air, where I lived at the time. I had a nice Midland SSB 23 channel base/mobile rig, I don't remember the exact model, and gave it away. I had been off the air for that length of time until about 2 years ago.

Now I got back in to radio with a Ham license. I have a Yaesu FT-847 in my apartment, and an Icom IC-706MKIIG in my 96 Dodge van. Neither rig is modified for out of band operation either. Every once in a while I will "dial down" to 11m to remember what I'm not missing anymore. After that I tune back to the Ham bands to have a nice QSO on FM, or SSB, with my friends on the air.

What looks like even more fun is operating on the amateur satellites. With Phase 3 D going up in mid November it means I can have a complete satellite ground station, working on 1.2 GHz and 2.4 GHz, where the Helix antennas will fit on a camera tripod, in my front room. Try that on 11m! CB radio, naw, I'm not missing a thing. 8-))

I just have to jump into this because I can't stand people bad
mouthing webtv .
Do you realize that in the time it takes me to get my computer
started up , connected to the internet and click on the first email that
I want to read , I could have already read over a dozen emails on my
webtv .
I would much rather sit on my couch and surf the web than sit at a
desk doing it .
Webtv works almost as fast as an average computer . The only thing it
lacks is the ability to download programs .
It's not as useless as most people ASSUME that it is .
I have built quite a few web pages using my webtv and theres no
difference between using a webtv or a pc to build them when your using
html codes . You do know how to build and use html codes don't you ! I
would assume that you do since you must be smarter than me because I'am
sending this letter from a webtv and your reading it on a pc (so you
must be smarter than me) .
Anybody can buy a pc for a thousand bucks and pretend they know what
they're doing ,BUT , I'am doing the same thing your doing and I only
spent a hundred bucks , and I'am sitting on my couch doing it .
Now who do you think the dumb fuck is ? You just keep pretending
that that you know more than any stupid webtver and since you like to
pretend so much , You can even pretend that somebody can here you
over my homebuilt key .
HMMM , I must be lying , because everyone knows a webtver ain't
smart enough to build his own box .

DESPERADO outta the buckeye's back out

Since when does webtv possess a bearing on someone's intellect or post? I understand and comprehend pcs just fine. Plenty of experience as well. Began making video games in 1980 on one hell of an old dinosaur and at the time, I had no idea there was even a term for what I was doing. Fact of the matter is, I could care less about the web. I'd rather be reading a book, outdoors, or DXing. The only reason I even reconnected to the internet is because the kids need it for school. I visit this ng, on occasion obtain some information, email, and that's it. I mostly work from home and a portion of my work, I admit, does utilize the net. That is up to my bosses. I used snail mail for years, it doesn't matter to me. To make blanket statements alluding to one's server only to somehow imply it correlates with one's ability or intellect is ludicrous. If it makes you feel better, though...go for it!

Not true. It is due to the wide spread use of amplifiers on 11m that the FCC has placed restrictions on commercial HF amplifiers, and even low band VHF, that prevents their use on the 11m CB band, AND on OUR 12m and 10m bands too! We have a legal right under Part 97 to use amplifiers on those bands, but because CBer's use them illegally on 11m Hams can't buy a commercial off the shelf amplifier for those bands. This affects EVERY Ham. And don't think this does not piss off many Hams either. In particular under FCC Part 97 section 97.317 explains what we Hams have to put up with because of illegal amplifiers being used on 11m. Yes, CBer's bother a great many Hams directly, or indirectly.

>
> Thanks,

Aaron, while your choice is adequate, you would be better served by upgrading to a Uniden PC68XL. Slightly more money, but a much better radio. I'm biased of course, because I'm running a PC68XL in my little Grand Am. I'm also running a K40 with the mag mount for my ant. One thing that really surprised me was the S.W.R. between the radio and ant. On channel 20 I'm running a SWR of 1.1, which is the best I've ever had on any radio without extensive tweaking.

Of course, if you don't have a SWR meter or know someone who does, you could go for the Uniden PC78XL which comes with a built in SWR meter, but it's not really useful.

Come on Mr. Alternator,

With your belt lagging, friction burning . . . brushless breath

state your answer to this problem

and may we be observant of your billwidered properties

Brass

> mouthing webtv .

WebTV users have a *reputation* for crashing into NG's, not attributing, and, generally, not having a clue. Note, I did not say "all" and I pointed no fingers other than at a specific webTV'r. Whatever.

> Do you realize that in the time it takes me to get my computer
> started up , connected to the internet and click on the first email that
> I want to read , I could have already read over a dozen emails on my
> webtv .

I have DSL. My comp. is *Always* on. What does this have to do with any statements I made? I made no mention of the appliance, just the user.

> I would much rather sit on my couch and surf the web than sit at a
> desk doing it .

Good for you. A good part of my work day is spent on the comp and on the phone. DSL allows me to do both without a second PH Line. You don't want to compare your service with mine. There is no comparison. But once again, that 's not what I was doing.

> Webtv works almost as fast as an average computer . The only thing it
> lacks is the ability to download programs .

And, it seems, to allow the user to attribute.

> It's not as useless as most people ASSUME that it is .
> I have built quite a few web pages using my webtv and theres no
> difference between using a webtv or a pc to build them when your using

What difference does this have to do with anything? :-)

I
> would assume that you do since you must be smarter than me because I'am
> sending this letter from a webtv and your reading it on a pc (so you
> must be smarter than me) .

I'll just say, "If you say so!"

> Anybody can buy a pc for a thousand bucks and pretend they know what
> they're doing ,BUT , I'am doing the same thing your doing and I only
> spent a hundred bucks , and I'am sitting on my couch doing it .

Again, good for you. Is that what you want to hear? Praise? OK then, You are "da bomb"!

> Now who do you think the dumb fuck is ?

You?

You just keep pretending
> that that you know more than any stupid webtver and since you like to
> pretend so much , You can even pretend that somebody can here you
> over my homebuilt key .

I would not say that I know more than *Any* wevTV'er. More than most perhaps.

> HMMM , I must be lying , because everyone knows a webtver ain't
> smart enough to build his own box .

I think you need to thicken that thin skin of yours, just a bit. You went so far afield with your accusations and complaining it was difficult to follow and keep in perspective. Your comments, for the most part, had nothing to do with the post I made. Mine was in response to a poster that was rude and, I felt, out of line. Yours was, well, I'm not sure what yours was about. Lighten up, brother.

I'm not sure if you are responding to me or the other Gentleman so forgive me if I'm wrong.

I did not allude anything, nor did I make a "Blanket" statement about webTV. I said that webTV USERS had a reputation. I said webTV'rs, apparently, don't know how to attribute (actually attribution was in response). As a method to getting on the Net I think they are great little devices. I do think they should be developed further and be given the abilities of, at least, a decent Word Processor.

If it
> makes you feel better, though...go for it!

Not sure how to respond to this as you probably misinterpreted what I was saying earlier and anything I say to that will only inflame this exchange further. I'm done with this topic. ;-)

IMO, I appreciate it when folks can post interesting and useful info as you
do. Fun and games (hash & trash) are OK as a diversion, but I enjoy reading
the posters that are actually doing something, as you are Jay.

Scott, if you still have that 100 watt amp, I'd probably prefer to run the 100 watts rather than 500. Aside from possible problems with the truck, 500 watts is a lot of rf to have around with the antenna sitting within 10 feet of your body. You will be somewhat shielded, sitting in the cab, but I'd still think about this a bit. A friend of mine is only running 100 and it does a great job without him worrying that he'll start glowing in the dark! (really, the big rigs should be attached to a skyhook mounted 40 feet or higher and away from the operating position)

thanks very much for the info. At least I have somthing to go on now. I did feel like he was hiding somthing. Maybe he just did not want to take the time to fix it. I may never know. I might crack it open myself and see what I can do. I really have nothing to lose just a few bucks for the transisters if I cant find them in some junk radios.

thanks again.

It IS true. Look, Leland. I don't doubt cbers exist that interfere with hammies. Just like I don't doubt there are crass hammies with the attitude that they are somehow "above" the cbers and blame them for their problems. You are one of them. You said it yourself in your post when you attempted to lay blame on the cbers for the hammies lack of success to acquire commercial amps off the shelf. You're a hammie, for crying out loud. Build one. Can you not handle this task?
I doubt you will find many hammies that share your view that the MAJORITY of hammies are bothered by cbers. I have pleny of friends who are hammies and I can say with great confidence your voice is of the minority. They have bigger fish to fry. You either have an unlimited amount of time on your hams, er, hands, need to get a better, stabilized rig for rejection, or are still wet behind the ears at all this.

3201. President Jackson Questions ????

Hi All
As im looking at getting hold of another Jackson I want to ask anyone with experience of the newer models if they still have the PB042 chassis. I have heard that the later "export" radios have declined in quality from the 148GTL-DX, Superstar 360FM, President Jackson, Grant etc.
Lastly does anyone know of a radio with all of the good points of the radio's above (excellent adjacent channel rejection, good sensitivity, excellent SSB quality) with all the modern features ????

Thanks

Just to get the facts straight, the same rules apply to linears capable of operating in the 27 MHz region whether intended for CB, Amateur, or commercial service. They cannot be offered off the shelf. The rules came about because of CB abuse. No attempt about it Twist, it is reality. The Amateur community suffered because of CB cowboys and thru no action of their own. Some are pissed and rightfully so.

Message-ID: <lWkK5.28106$Xc.1327181@nntp2.onemain.com>
Source record: 57095

Well from your drawing it looks like you have your ground radials attached to your main vertical radiating element. The ground radials must be connected to your shield of the coax and not the main vertical element.

Your coil is bypassed by the copper pipe your using as your driven element so the coil isn't doing anything for you in your drawing. You need an insulator inside the coil disconnecting the lower part of the driven element from the top section. Then your coil connects them back together. I assume your trying to use the coil as load? If it's just for looks then that's another story. If you look at a coil type mobile antenna you can see the insulator in the middle of the coil. The vertical copper pipe should not be one solid piece straight to the top. It looks like you have a lot of studying to do on antenna design. Take a look at an ARRL antenna book. These are just a few quick observations I saw but there are many other things that could be wrong such as the lengths and diameters of your tubing and ground radials. It all has an effect on your SWR, Field strength, and impedance.

Leland,

But as a licensed ham operator you can legally modify those amplifiers to work on those frequencies.

If you find you are incapable of doing the modifications yourself, just take the amp to your local CB shop and ask the ham operator who works there, (or owns it), to modify it for you.

I'm sure they will know exactly what to do.

Dick,

I agree with all of your post except the part that says " thru no action of
their own".

If you can group CBers (both good and bad) then I should be allowed to group
Ham Operators.

In that case I would say the ham community, who started the problem in the
first place, got what they deserved.

I don't doubt a certain segment of your post, Richard. The validity of abuse probably holds true, but as you say, to set it straight, the abuse continues.....by both segments of radio ops. Maybe in the beginning, that is why amps cannot be bought, but it is so far removed from what I was attempting to convey. I feel a hammie has every right to be ticked at a cber squatting on their bands. Just as I feel cbers have a right to be ticked because hammies make blanket statements pertaining to cbers, such as what I retorted to. But the majority of hammies are not hassled or bothered by cbers. My personal feeling is that a certain segment of hammies are just plain pissed off because of the amp thing...and your "average" cber does not run kilowatt capable amps..as I said..if it's interfering, that one thing. But to hold a grudge against cbers because of a law they may have had something to do with years ago, why, we might as well start demanding reparations for each person that feels a law has somehow inhibited or prevented them from something or another.

3211. Re: Is 500 Watts too much for a new truck?

Source record: 57098

Greetings!

Er, no...for the reason you've listed - doing strange things. I'll share some notes...you decide...

I had some internal engine damage done to a Chevrolet Sprint [before Geo] possibly due to the torque of using a linear and the stress placed on the harmonic balancer and the crankshaft and it's keyway/dog clutch used to turn the pulleys for the water pump and alternator. I was in the process of get the vehicle repaired after being hit by a *blasted* Whitetail [deer] when the subject came up.

The reason I say possibly, is when the vehicle was hit by the deer, I was driving on a highway. The impact plus sudden decelleration added to the problem but they could not understand how it did that much damage. They were trying to blame me for an accumulated damage claim, when the whole subject was about repairing the vehicle after the collision with the deer.

I wound up having to pay for a newer motor to be dropped into the vehicle, but they paid to repair the sheet metal damage.

I also used to run an HR2510 in a Ford Aspire - and I used to get the "Check Engine" light on occasion.

Whats weird is, when I continued using the HR 2510 to chat with people as I left the keyswitch in the "On" position to check for the codes, it would "reset" [check Engine light would go out] on it's own if I whistled into the mike on 30 LSB.

It was discovered by accident one day, when one of the guys wanted also to "check his radio and see what his S-meter would show when I keyed the mike."

Whenever the "Check Engine light" came on afterwards, I could reset the light to go out by simply whistling into the mike on ch 30 LSB on that radio. The engine would sputter for a moment or two then continue running. Reflecting on that - boy I was stupid for taking that kind of a chance! [LOL!]

And on some occasions, when chatting with people for a long time - re-starting the engine to charge up the battery and go home [lived in an apartment at the time] the vehicle acted as if the system had reset and ran strange for an hour or two and would then settle down and run fine afterwards.

Changing radios to another PC-122, Emperor TS-3010 - I never got this strange quirk in the Ford. Light never came on, and never gave me a problem when using another type of radio.

So, as far as running power, I'd run with a radio in the vehicle for a month under different conditions first. If any changes in performance, while using a typical radio - don't try running power.

Maybe you're getting too much info here, but the premise is the same.

Be careful! If you don't know, then don't try it if you can avoid it.

On Thu, 26 Oct 2000 09:30:04 -0400, while the modem was pondering it's navel, Scott <scott2rp789@netscape.net> dissertated the following:

What are you trying to do run capacitors instead of batteries? If so what type of regulator are you using? there is no magic value of capacitor you should be looking to achieve about 10% ripple ... so what ever value it takes to get this is what you would want. If you do not have the correct regulator it will not charge since the caps will not have enough voltage for the regulator to sense the voltage to tell it to start charging .... I hope you are taking notes Brass this info usually costs people alot of money, especialy to those who dont know how to set it up ...

Tim,

The output impedance of the T+2 is about 2.5K ohms when the mike is wide open, and decreases towards zero as you turn the gain control down.

I believe the input impedance of the Yeasu is designed around a 600 ohm dynamic mike impedance.

The Turner should work fine but it may overdrive the mike amp in the Yeasu.

I think I would add a 1/4 or 1/8 watt, resistor in series with the audio lead of the Turner mike, and would locate it in the mike plug so it would also act as an RF feedback attenuator.

I would start out with a 1.8K ohm resistor as a minimum value and increase the amount of resistance until I obtained the optimum combination of mike sensitivity and audio quality.

There is a good chance that the 1.8K ohm initial value will work fine.

It's bad enough that CBer's are using illegal amplifiers on 11m, but give me a break, are there really CBer's out there dumb enough to use a class C, NON-LINEAR, amplifier on a linear mode like AM, and SSB? Using a class C amplifier on AM is the fastest way to piss off other operators, loose friends, and attract the attention of the FCC. I recommend you get one, more "swing" for the buck, and a big fat fine too.

I would love to disagree but really can't as far as starting it. But the
amateur community had nothing to do with the Yahoos, exports, etc. that came
later.

As I noted, there really is not and has not been conflict with the SSB
community. God knows I have tutored enough of them. The Ancient Modulation
brigade is a whole different kettle of fish. They offend both technically
and artistically; so much trouble to sound so bad.

3221. Siltronix web page (new)

Here's the deal:

I am leaving town tomorrow AM and could use the extra cash ASAP. If you are interested in the items below and CAN PAY BY PAYPAL USING A CREDIT CARD ONLY, then I will sell it to you and ship it today (only).

Uniden President HR 2600 w/Chipswitch PLUS a Turner +2 and a Cobra power hand mic both wired for the 2600. $200.00 INLUDING SHIPPING to a US address. The 2600 comes with the box, manual, power cable, stock mic, mounting bracket w/thumbscrews, and the Chipswitch manual is included also. Covers 24.800 to 29.999 AM/FM/SSB/CW and has recently been aligned and checked over. Great output and appearance too.

By and large, I agree with you. There is no inherent conflict; amateurs have no more reason to care what happens below 28 than reason to care about the program schedule of the BBC. As has been noted here, us old farts are probably your best friends.

The crime here has nothing to do with linears; the EBay caper is just a shot across the bow before one quiet day when purveyors of power and vendors of export radios find themselves served with indictments and RICO actions that will bankrupt many and cause a few to scout the route between KCI (Kansas City Inconvenient airport) and Leavenworth KS for their visitors.

Only the blind cannot see that the 28 MHz line will be defended.

:Dennis W. Ostrowski <dwostrowski@lucent.com> wrote:
: Larry Moskal wrote:

Hi Dennis and Larry,

Larry, you didn't mention what model amplifier you have, but we assume
that your talking about the palomar 300a multiband amplifier... or one of
their similar models.

:> expect anything else was affected or not.

Bad news, operating that far out of band and out of tune to boot. You
probably flattened the tubes and there might be something else bad with a
failed part. Fuse blowing is bad news, especially if it's the house mains
first.

: You could have wiped out your bias supply.

near impossible to tell without it on the repair bench and the proper
tools with instruments.

: You could have also wiped out the plate choke in the final (4 tube) amp. stage.

You could have made latte... can't tell anything without my above
mentioned setup.

: One thing that should not have happened was the fuse in the electric box
: blowing before the fuse in the unit did.

True, but a weak mains breaker (old and wet many times) will often trip
early... sometimes trip late or worse, not at all.

: Has the fuse been bypassed, or has it been replaced with a fuse from a solid
: state linear which would have much to high of a current rating?

a big problems...

: I believe that unit came stock with a 10 amp fuse in it, which would equate to
: roughly a 1200 watt maximum continuous DC power INPUT level.

Way to large for the palomar 300a. The fusing on some of the 300a
versions through the years was put in a bad place, circuit wise.

: Unless your house fuses are rated at less than 10 amps, the fuse in the amp.
: should have blown to protect it from self-destruction.

See my comments above.

:> Does anyone have some of
:> these tubes for sale or know where I can get them reasonably priced?

: Bob, N9TEW, who posts on here.

but are they priced right..? Check with the local ham and electronics
flea markets. Some of the casual dealers not trying to make a million each
deal can be found on here. Check the rec.radio.swap news group.

:> I believe now that this operates in low power with one driver and two
:> finals and high power with both drivers and all four finals. Is this
:> correct?

: No.
: In low power mode it completely bypasses the drivers and uses only the (4) tube
: output stage, which is a really nice feature if you want to have a higher power
: export or a ham radio driving it.

If it's the normal 300a amplifier. 40 to 60 watts max input on low power
setting. Never over 4.5 watts on high power settings. Fresh tubes and a
solid circuit values.

:> If so, I could change the bad with the good, and still operate
:> on low while I wait for the tubes.

: You can if you have (4) closely matched good ones.

Almost on... there are tube balancing circuits which I've added to this
amplifier which allow it to operate without close matching tubes. Similar
condition and type tubes will work in the stock amplifier.

: And if you bias supply and plate choke are still intact.

You wouldn't be able to tell without a tech/engineer checkout first. I'm
not sure what got Dennis so excited about the bias supply and/or the plate
choke, but everything should be checked before you toast a new set of
tubes.

:> I was operating in low power when this happened.

: Then your drivers were always like that, with one weak one and one
: strong one.

I would never assume that, but it's probable.

:> I know this is very long but I couldn't figure out how
:> to get my point accross in any less words. Any information would be
:> appreciated. I just got this linear fairly recently. I'm used to solid
:> state mobile linears.
: That's why you forgot to retune!

:> Thank you very much for anything you can offer.
: I provided what I could, but I'm sure that Doc or Hamm4fun or one of
: the other ham operator amplifier experts on the CB newsgroup can
: provide you with a lot more information.
: #12

I have the original owners manual for the 300a scanned in and I've emailed it to people in the past. Just send me an email direct if you want a copy. Get someone who knows this type of amplifier well to look at it for you. A new set of tubes along with a proper checkout will let you have some fun for years into the future.

It's a great amplifier for ham radio operation.

cheers

If you were going the other way... from low to high... it wouldn't matter.
However, with your situation you may lose significant gain unless you match.
You could do that with a single stage transistor amp with minimal gain for
stability.

3228. Clearance Sale on T-450's

Newsgroup: rec.radio.cb
Date: 2000-10-27 21:55:45 UTC
From: nadzam@garlic.com
Message-ID: <svjuf14a0r983c@corp.supernews.com>
Source record: 57116

Clearance Special.
Trucker 450 Power amplifier
Manufactured by the Messenger people.

Features: Qty 4, Thompson SD-1446 Power Transistors.
High/Low Power selector switch, Class C power amplifier.
Receiver Pre-amplifier. Should not be used with SSB.
Good for AM/FM operation. Requires 35~40 Amps Peak
at 13.8VDC for proper operation. Average current 24~28 Amps
on High power level with a input carrier power of 4 watts.

All sales are final.
Units are bench tested before shipment.
$175.00 DOA Warranty.
$200.00 90 Day repair Limited Warranty.
Will not cover overdrive, or misuse.

Prices do not include Shipping and Handling.
Purchase three or more on one order,
and shipping is FREE!

I agree with hillbilly on the 520 being a little noisy - I've got one I never use except as a monitor.

Most importantly I'd make sure you get a good antenna. I use a Wilson 1000 mag mount and it sure beats those smaller mag mounts.

IMHO, the 5000 is overkill for what it sounds like you'll be doing. The 1000 might even be too, so peakaboo's thought of a 500 would be good. It's good up to 2000 watts and you won't be touching that.

The drawback to my 1000 is that even when mounted on the trunk of my car, I have to take it off to get in my garage. Bends gently around and fits in my trunk easy enough. Actually reading the specs at http://www.wilsonantenna.com/product.htm , I might be able to get in if I used the 500 instead of my 1000. The whip on the 500 is 54" v. 62" for the 1000. I just hate to part with my 1000 though.

The mag mount on the Wilson 1000 is super strong and won't blow over at high speeds.

Plus if you decide to get a more powerful setup someday, you'll like knowing you've already got a very good antenna and won't have to upgrade that.

If you're looking to improve the transmit sound of your radio, one of the most cost effectinve things to do (again just my opinion) is to get a good noise cancelling mic like the turner RK56 or an Astatic. Obviously it's a good idea with any new radio to have a reputable tech take a look at it to see that it's all set up as good as it can be too.

-Toby

Source record: 57123

On 27 Oct 2000 21:12:53 GMT, "CitySlicker" <manno_d@hotmail.com>
wrote:

>You might consider driving your 4 pill with that 2 x 2290
>

I actually tried that out for fun. It really didn't add but maybe 100
watts to my over all output. I was running it on it's low setting
which only peaks at about 80 watts.

With just my x-force I can run my RG99 at about 7 watts deadkey and
swing about 30 and just flip on the amp without dialing down the
power. With the 2 pill in front, I have to lower my deadkey and back
off my dynamic to keep a clean sound.

The main thing is that I have my x-force in the trunk and like being
able to turn it on and off from up front in my car without having the
actual amp sitting up there with me. I'm pretty happy letting my
x-force run without pushing it very hard. Keeps it cool and clean
sounding.

I must say though, that if I could have figured out an easy way to
remote mount the Galaxy, I might have done it. The catch for me is
that I like to turn off my amp when it's not really needed for close
range comms.

Maybe I should hook it up again and run it on it's middle setting
(peak 200 watts) - I bet that would really make those 4 2879's start
talking. I just didn't want to run the risk of damaging my 2879's by
pushing too much power into them - I was kind of thinking pushing
around 100 watts in was as far as you should go for some reason (every
body feel free to comment on this).

Anyway, for now, I'm just looking to sell it. If I don't get a buyer,
maybe I'll hook it up with a quick disconnect and put it up front with
me when I feel like using it.

Thx cityslicker.

Seems everyone is off track here is the original post.

NEWINGTON, CT, Oct 24, 2000--The FCC says it has reached an agreement with
the eBay auction site that's aimed at curtailing the sale of clearly
illegal radio equipment.

FCC Special Counsel for Amateur Radio Enforcement Riley Hollingsworth says eBay
has agreed to cooperate in removing advertisements in which the item for sale "is clearly
non-certified." Hollingsworth said most of the equipment involved falls into the CB
category, including illegal amplifiers.

"I've got a whole folder of people who have been complaining about this and will be
delighted to know that the Commission is taking action," said the ARRL Regulatory
Information Branch's John Hennessee, N1KB.

Hollingsworth said a review team within the Technical and Public Safety Division of the
FCC Enforcement Bureau is screening eBay ads each week. He said the practice could
be extended to other auction site if the FCC learns of similar problems.

Hollingsworth credits complaints from the Amateur Radio community with getting the
new system in place. "I've been collecting complaints for a year, but the amateur
community really generated it," he said. Hollingsworth says he sees about 10 complaints
a week about auction site advertisements--sometimes several about the same ad--and
has been forwarding all complaints he receives to a "duty team" within Technical and
Public Safety. He cautions that complaints should be based on clear-cut FCC rules
violations, however, such as attempts to sell illegal linear amplifiers.

"Amateurs can keep sending me items, addressed to fccham@fcc.gov," Hollingsworth
said.

wins.

Does anyone in this NG know how to attribute? Jee-Zus!
By the way, cable does not automatically win. Where did you hear that one?
My neighbors can't turn mine into a 56k dial-up by "clogging" the lines
either, like your can to you. I be the same 1 to 1.5M down, all the time.
:-) Only 128k up though. :-(I thought about cable but DSL is the first
one of the two to come to my area.

The point here is that by hooking the high impedance mic to the low
impedance set... you will be loading the mic heavily. This will probably
negatively impact the mic gain and perhaps the sound quality as well.

Scuzz me! I guess some ham shops would sell amps that are carrier controlled and operate on CB but the amp is definitely not certified if it can do either. The amp will have to be tuned for the CB band but yes a ham amp can be used. The class AB sounds nicer on SSB and AM. Class C amps are bang for buck amps and don't work on SSB and some splatter rather nicely on AM.

I was half asleep is my excuse. We all have one. :)

> illegal CB radio operation.

Mr. Voobner,

I was advising LICENSED HAM OPERATORS as to what modifications they were legally allowed to make, and I referred them to other LICENSED HAM OPERATORS to get the job done.

Mind telling me what is so illegal about that?

If you have any examples of me dispensing illegal information on this news group, I would like you to produce them.

The amplifier efficiency discussions were technical discussions without any instructions as to how to build one, although even that would not have been illegal because I addressed my responses to a thread where licensed ham operators were actively participating in the discussions.

I had a ham license before I was a teenager and didn't like it except for the hardware and technology.

I tried CB and didn't like it except for the hardware and technology.

You can ask the folks who live near me and they will tell you that I do not have any desire to yak on the radio, nor do I have any 2-way radio equipment of any kind in any vehicle I drive.

That fact really IRKs some of my radio oriented friends around here, but I found that I would rather listen to Willie Nelson or Leonard Cohen than someone kerchunking a repeater just to see if they could 'hit' it, or someone doing a ritualistic 30 minute tune-up sequence with all that whistling AND WITH ECHO....

I had a 1st class license in the early 70's that has since been grandfathered to a 'GENERAL' class radiotelephone license, so I am licensed to work on amplifiers that even extra class hams are not allowed to work on, and have even done repairs and modifications of equipment for the local FCC office.

With the new licensing rules giving credit for prior licenses, I understand that I could get a ham license again by just calling the local VEC.

But I have no use for one so I never even inquired about it.

I happen to enjoy the technical debates about amplifier theory that seem to occur mostly on this news group.

I also believe I have a lot of information I can share, both technical and historical, because I have been around a long time and have worked on a LOT of radio equipment.

The information I put on this news group is as accurate as I can make it, even if some folks refuse to believe it, or as in your case, are offended by it.

You sir, are not worth risking my livelyhood for, so if you or anyone else wants me off of this news group that badly, I will leave.

Good Bye!

As anyone who has the capability to look me up on qrz.com or buckmaster knows I live in the Omaha area. While I did manage to stay gone from here for 31 years it is where I grew up. In pre-Interstate days, US6 crossed the Missouri and put you on West Broadway in beautiful Council Bluffs IA and at 3615 was World Radio Labs where the Globe thingees were made.
Maybe like the prophet with no honor in his native land, we locals leaked on them perhaps more than was justified. NAAAAH. Leo Myerson is still with us sayeth some of the local QCWA types.

It took cast-iron cajones to run 11 meters in its ham band days. Some poster said it was taken from us in the Atlantic City Conference in 1947; actually it was given at that conference as payment for part of 20 meters. We also got 15 in the bargain. Both new bands ran afoul of TV. The tuners in them days put the channel (inverted, oscillator hi) between 21 and 27 MHz with the video carrier at 25.75. Probably why the power limit was too low when it became a business band (yes gang, CB was to provide lo-grade business communication). My own feeling is that CB was done by a bunch of summer interns at the FCC; the original callsigns were the FCC engineering office, followed by W, followed by four numbers as in 17W0908. The ITU pointed out that these were not in the treaty. Does not seem to be the type of error made by pros.

At one time there was an award for working all functioning Drake TR7s. If you are a good boy I am sure we could come up with some sort of award for the Worlds Only Functioning Globe King, or Globe Chief, or Globe Scout, etc.

Relish the thought!

I guess I should have asked what model of Yeasu.

I was referring to the FT101.

If I remember correctly, there IS a coupling (dc blocking) capacitor in series with the audio lead inside the Turner modulated mike.

I believe the bulk of his problem is going to be all the gain he already has.

With the gain of the Turner internal mike amplifier multiplied by the gain of the Yeasu mike amplifier, he can afford to take the loss of the purely resistive matching network.

So I think he can solve his impedance matching problems AND his too much gain problem at the same time with just a simple, passive, resistive voltage divider.

A 10 cent FIX!

The Turner +2 had a built-in solid state amplifier that matched impedance as
well as amplified the mike.

Yep, a great shape pair of these receive tune up tools for any CB shop or a wanna be CB shop, these CLASSIC test equipment pieces will just increase in value. A shop had them that did more than CB and was in biz over 50 years (so they weren't used that much). $400 & ship. is really cheap, since I paid over $200 for mine in 1981 dollars then--look how much the paper $$$ has become more worthless than then! And these are still in GREAT shape & working now! So e mail me back @ truth@planetc.com for any questions or details
and I can get you started making the BIG $$$$ tuning up receive sections of them Classic CB radios (and the new ones too!) !

Reactance fools SWR meters. If the resistive component
is 32 ohms, and the reactive component is 18 ohms, the
SWR will be 1:1--but the field strength will be less than
if the impedance was 50 ohms resistive.

The A-99 is not a Marconi (1/4 wave plus ground plane)
type of antenna. Unless it is mounted very close to
the ground, it is not ground dependant.

Mine is tuned for lowest SWR on Ch.40 since I often venture
into the "freeband." Tuned that way, the 259B sees it as
42 ohms resistive and 8 ohms reactive. That adds up to 50
ohms, and every SWR meter I've tried sees it as a flat SWR.
Mine does have the ground plane kit. I figure it helps
keep the coax shield from radiating.

>Subject: Re: FW: Annual Check-up

An elderly couple scheduled their annual medical examinations
on the same day so they could travel together.
After the examination, the doctor then said to the elderly man:
"You appear to be in good health. Do you have any medical concerns that you
would like to discuss with me?"
"In fact, I do," said the old man. "After I have sex with my
wife the first time, I am usually hot and sweaty, and then, after I have sex
with my wife the second time, I'm usually cold and chilly."
After examining the elderly lady, the doctor said, "Everything
seems to be fine. Do you have any medical concerns that you would like to
discuss with me?"
The lady replied that she had no questions or concerns.
The doctor then asked, "Your husband had an unusual concern. He claims that
he is usually hot and sweaty after having sex the first time with you and then
cold and chilly after the second time. Do you know why?"
"Oh that old fart!" she replied. "That's because the first time is usually
in July and the second time is usually in December."

3284. Al Gore Praises Texas

Newsgroup: rec.radio.cb
Date: 2000-10-28 04:44:34 UTC

Message-ID: <39FA59B2.EA20B174@altavista.com>
Source record: 57272

Why does Al Gore say one thing, when the truth is another?

Take for instance Gore's attacks on the Texas record. Looks like he had a different opinion in a White House press release. Look what Calvin Woodward of the Associated Press had to say about Gore's stand on the Texas record:

"After all the bad things Al Gore has been saying about the state of George W. Bush's Texas, it seems conditions there are on the mend after all.

Says who? The Clinton-Gore administration.

The White House has a Web section listing "Clinton-Gore administration accomplishments" state by state. Some of the headlines for Texas sound like a campaign ad that could be run by Gov. Bush, the Republican presidential candidate, and not at all like the Texas that Gore is describing in his Democratic campaign.

The White House says of the state:

-"More high-quality teachers with smaller classes for Texas' schools."
-"Crime falls 15 percent in Texas."
-"496,746 fewer people on welfare."
-"Health care for nearly 50,900 uninsured Texas children."
-"More toddlers are being immunized."
-"Child support collections up 178 percent."
-"2,005,800 new jobs."
-"Homeownership has increased in Texas."
-"11 toxic waste sites cleaned up."

-Calvin Woodward, Associated Press

Don't believe it? Click on the link below to the White House.

It depends entirely on the amplifier. With tube type
amplifiers, a 2:1 may not be that bad at all. Most solid-
state amplifiers don't 'like' a 2:1, but like I said, it
depends on the amplifier.

Leland C. Scott <no-spam@junk-mail.net> wrote:

:> and the majority of hams are not bothered by cbers

: Not true. It is due to the wide spread use of amplifiers on 11m that the FCC
: has placed restrictions on commercial HF amplifiers, and even low band VHF,
: that prevents their use on the 11m CB band, AND on OUR 12m and 10m bands
: too! We have a legal right under Part 97 to use amplifiers on those bands,
: but because CBer's use them illegally on 11m Hams can't buy a commercial off
: the shelf amplifier for those bands. This affects EVERY Ham. And don't think
: this does not piss off many Hams either. In particular under FCC Part 97
: section 97.317 explains what we Hams have to put up with because of illegal
: amplifiers being used on 11m. Yes, CBer's bother a great many Hams directly,
: or indirectly.

Then learn enough simple electronics to modify the amplifies with the kits
that you can get from the manufacturers. I haven't seen an amplifer yet where
the modification would have challenged me when I was 10 years old.

Or are most Hams now "appliance operators", as some Hams complain - and not
capable of such elementary tasks?

What is the best car mount antennae to buy? I have a cobra 29 radio to add to it. Also could you explain the steps on setting the swr.I don't have no kicker
either.Any help would be appreciated.

Thanks

Bill

IT'S A DAMN SHAM THAT YOU PATED 100+
FOUR A AMP AND YOU ARE GETTING ALL OF THE DICK HEAD'S ON YOUR ASS!!!
BUT WHEN I HAD MADE THE "CLASS B"
AMP WITH #12 ILL.
WE PRICE IT AT $20.00 PER. STAGE.
SO IF YOU HAD A 2-PILL IT WAS $20.00 MORE OVER THE PRICE OF THE AMP.
NOW IF YOU WOULD NEED A SWICH TO TURN YOUR SSB ON & OFF THAT WOULD COST
$10.00
IF IT WES ON SSB ALL THE TIME IT WAS FREE...

NOW I CAN'T TELL YOU ALL HOW THE X-FART TEAM IS DOING IT NOW!!

AND WE ALL KNOW WHY THAT IS../????!!

SO ALL I SAYING IS THAT IF YOU GOT FUCK BY WHO EVER YOU GOT THAT SHIT
FROM THAT'S TOO BAD!!!!!!!!!!

AND YES THIS IS THE "123" THAT STARTED THE X-FORCE LINE.....

HI Thunder
At my company we have the same problem with the new Volvo's. We've tried about all of them and a Wilson 2000 SW 22" shaft seems to be the best all around but it's just a little bit better than the 4 or 5 foot fiberglass Wilson or firstiks and costs 3 times as much. I have both and the 2000 seems to receive better and get out better to the sides but not a lot of difference. Some guys swear by Francis whips and they are so cheep I might try one for the hell of it. Good Luck BIG DOG In South FLA

Bill,
Here are some general ideas about operating mobile. there
are exceptions to everything, so bear that in mind
In general;
1. The shorter the antenna the less performance. A full sized
1/4 wave length antenna is about 9 feet long. Anything
shorter than that is going to be a compromise, but that's not
necessarily bad.
2. The 'best' place to mount an antenna is as high on a vehicle
as possible. There are problems with mounting a 9 foot whip
on the roof of your car. You hit everything you pass and
your wife will probably be hitting you too. The idea is to get
the antenna above surrounding objects, where possible.
3. Most cars, especially the newer ones, are noise generators.
You may have to 'cure' a noise problem by adding capacitors,
ground straps, or 'chokes' to the vehicle's wiring. This can
range from "very simple" to "ain't no way!", but in general
really isn't all that bad.
4. SWR is a topic all by it's self. Very simply, you want to
have as little as possible. You need an SWR Meter to check
to see what the SWR is, then 'tune' it out by adjusting the
antenna. The best advice is to READ the MANUAL that comes
with a meter! You don't really have to know what SWR 'is',
but you do need to know how to operate the meter.
5. There are NO 'magic' lengths for coaxial cable! The 'ideal'
length is what ever it takes to get from the radio to the
antenna, then add a couple of feet for convenience. Coax
is fairly delicate, don't kink/mash/crimp/nick or pull on it.
If you use "used" coax, more than likely your using some one
else's 'problems'. Other wise, why did they change it?

Half the fun is 'getting there', so don't be discouraged
by any of this. It really isn't that bad, and you'll have
fun along the way.

Good luck...
'Doc

Since the question was asked, no, I don't believe it. I don't believe claims by either camp. The savvy media is controlled by a dictating and authoritarian monopoly which censors and reports half truths and manipulates statistics to their advantage. Do some research instead of blindly believing whatever crumbs are thrown to the public.

Good Point. A better one is just why one needs more than the 100-200 watts
that most transceivers put out. When the propagation gods love you, a
resonant Zippo is enough; when they hate you, 50kw won't help.

I will be the first to admit that I don't know how to "attribute" in the sense that you mean . I know what attribute means and I don't understand how it is that you want us to attribute . PLEASE EXPLAIN ?
I didn't say that webtv was as fast as a computer . I said It's almost as fast as the AVERAGE computer . I never said anything about comparing it to a fast connection with a great computer .
Like I said , I do have an average computer and I prefer to use my webtv when I'am just surfing around .
As to your comment about webtvers trolling and then leaving , Its just not right to condem somebody because of the server they choose . Comments like what you made unjustly discredit everybody that use webtv and create an attitude for others to disregard any posts that are made by someone using webtv .
There's a few great techs in this group so unless somebody asks a question that I can answer just as well as the better techs , then I don't reply to them , but when I do rely to somebody I don't expect them to ignore my post just because I sent it from webtv .
I come to this group to give and receive info . I have NEVER trolled anywhere on the net and I never will . Maybe now you understand why I acted so thin skinned when when I replied earlier . What you said was the equivalent of a racial slur .

I remember the black day when Collins, in response to govt auditors, raised their amateur prices to match what they were charging Sam. There is no doubt that owning Collins today is a religio-orgasmic experience more than simply owning the best on the block. At the end of the AM wars on the ham bands, however, I still find it amazing that some of the capitalists that owned Collins AM did not find a way to unload obsolete gear on some equally capitalistic but unknowing CBer. Collins always has had Rolls-Royce status but didn't acquire Buggati cachet until a bit later.

In the train shed at St Louis Union Station (built for the 1904 World Fair) is an award by the American Society of Civil Engineers to the company that designed the shed lauding it as a prime example of what can be accomplished when price is no object. While not deserving of quite this backhanded complement, there is no doubt that Collins profited from having the US military as its major customer. Nothing like a client willing to pay for the best.

FCC TO MONITOR AUCTION SITE FOR ILLEGAL ITEMS

The FCC says it has reached an agreement with the eBay auction site that's aimed at curtailing the sale of clearly illegal radio equipment.

ARRL Letter
Vol. 19, No. 41
October 27, 2000:

FCC Special Counsel for Amateur Radio Enforcement Riley Hollingsworth says eBay has agreed to cooperate in removing advertisements in which the item for sale "is clearly non-certified" under FCC rules. Hollingsworth said most of the equipment involved falls into the CB category, including illegal amplifiers.

>Hollingsworth said a review team within the Technical and Public Safety
>Division of the FCC Enforcement Bureau is screening eBay ads each week.

Well like Doc said there is allot to consider (as I am learning trying to build a base antenna...lol) but for a mobile I have found that for a mag mount not much can compete with a Wilson 5000. Like doc said you will need an SWR meter to set up the antenna, there will be instructions on how to set the SWR with the meter and with the antenna. Have fun.

Generally speaking, the better "tune" your vehicle is in, the less noise you'll be likely to pick up with your cb. Personally, I highly recommend the wilson 1000 antennas. It's not too ugly, is decent for broad banding, and if you add a "kicker" later, the antenna will handle the power. Hope this helps a bit,
Jagzilla

In the last month or so, I've seen quite a few linears yanked of ebay, but I just saw the first Superstar 3900 get yanked.Seems like maybe "export" and "modified" radio's are also going to be targeted.Kinda pisses me off, when it's the FCC running the show,but ebay is international in who buys from it.
Just my two cents worth,
Jagzilla

I think if you could arrange for the six 'band' radios to magically have the
top two disappear the FCC would go back to sleep. Until they do, there will
a rough way to go. The 28 MHz line will be defended -- depend on it.

3314. More setup opinions please

Thanks to everyone that has provided me an opinion on some of the units I am looking at. I still have some other questions as I continue to refine my search.

Does anyone have any experience with any of the Midland radios? I am looking
at the 77120ESP or 77235ESP radios in particular.

I am also looking at one of the Uniden 78LTW's in comparison. I believe I can mount the Midland radios in the dash, under my car stereo, but the Uniden would have to go under the seat. Also, I can get the Uniden which has a built in SWR meter for about $100, or I can buy one of the Midlands and a SWR meter for about $100. Which is the better way to go?

Thanks!

Does anybody know anything about xforce regulators? It quit working. I think they get too hot because they have no heat sink. I think it has one pass transistor and one voltage regulator. Both are in the tip configuration. Thanks.

Voobner,
So here we go again. Mark Fuller II.

Why does a discussion on amplifier theory offend you so much?

You might just learn something if you could get your head out of your a$$.

Shame you weren't in Nazi Germany, you could have been a great book burner.

You Rat Bastardos!!

No ham gear requires certification so I am not sure what your question might
be.
It is the act of transmitting on it that gets into the regs, not possession
with intent as with 27 MHz gear.

Over the years a lot of military gear was converted. Two meter repeaters
owe their origin to oceans of 15KHz swing FM gear that became available when
business band channels were split as part of the same program to increase
commercial space that got CB started. There were a number of Antique
Modulation broadcast transmitters that ended up on 75meters. In the early
days of sideband, one company converted old ARC-5 transmitters to VFOs;
looked kind of silly in a sky blue case with an OD knob.

By and large, the Amateur Service has proved to be a reasonably trustworthy
bunch at least with respect to hardware and respect for frequency limits.
To compare the hams track record with freebanders is simply ludicrous.
Incidentally, if you want to listen to the longest freeband floating craps
game in history listen around 6.5-6.7 MHz; 45 meters has been going on since
WW2.

the person has a negative 1 rating big deal who knows what happened but if
he pays $60 for the radio what difference is his rating?
I also believe the radio was new so $60 for a new 25 is a good deal in my
eyes ..
